Pupil. Opening in the centre of the iris or coloured part of the eye. The iris has muscular fibres by means of which the pupil can be dilated or contracted so as to regulate the amount of light which passes into the eye. In the presence of a strong light, or when gazing at a near object, the pupil contracts. Shading the eye, or gazing at a distant object, causes the pupil to dilate. Certain drugs called mydriatics, *e.g.* atropine, when dropped into the eye cause the pupil to dilate; others called myotics, *e.g.* physostigmine, cause it to contract. Paralysis of the nerves supplying the iris leads to partial or complete loss of its function, a result which is of value in the diagnosis of nervous diseases often associated with a late form of syphilis. The word (Lat. *pupilla*, little doll) apparently refers to the reflected image seen in the pupil; *cf.* the O.E. phrase "to look babies in the eyes." In another sense—the derivation being the same—the word is used for one who learns from another. See Eye.

Pupin, MICHAEL IDVORSKY (1858–1935). American scientist. Born at Idvor, Serbia, Oct. 4, 1858, he went in 1874 to New York, where he studied physics and mathematics at Columbia university. He pursued the same studies later at Cambridge and under Helmholtz at Berlin. Back at Columbia from 1890, he held minor teaching posts before his appointment as professor of electro-mechanics in 1901. Distinction came with his discoveries in relation to the X-ray, and his success in the extension of telephone and telegraph circuits. Pupin did not

confine his published work to technical treatises, but revealed a fine style in *From Immigrant to Inventor*, 1923, one of the best autobiographies ever written by a European-American. He died March 12, 1935.

Puppet (Fr. *poupée*, doll). General term which includes shadow puppets, rod puppets, glove puppets, glove-rod puppets, and marionettes. The earliest form of puppetry known is the shadow show of ancient China, the *ombres chinoises*, which reached the U.K. by way of Java, India, Persia, Turkey, Greece, Italy, and France. These puppets, whose shadows were thrown on to a screen illumined by the sun, were made from animal or fish skin, preferably buffalo hide or shark skin, which, after being beaten to the required thinness, was dyed, shaped, and jointed to produce whatever movement was necessary, and then mounted on canes or rods. Processions, groups of persons, even single puppets sometimes, were not articulated. This type of puppet, made from specially prepared paper, parchment, or coloured plastics, is, with suitable lighting, very effective.

Rod puppets are figures in the round, usually legless, whose costume or draperies hang down from the waist, hiding the absence of legs. They are carried on a rod that passes through the body into the head, by means of which the head is moved; rods fastened to the hands move them. Graceful and lifelike movement can be suggested by the expert manipulator. Javanese puppets of this type are exquisite examples of the art of the native carver, and are beautifully lacquered, enamelled, gilded, or painted and finely costumed.

Glove puppets are simply gloves worn on the hands to which the head and arms of the puppet are fixed, manipulation being effected by the thumb and first two fingers. The traditional English Punch and Judy worked in this way was popular in England early in the 14th century and there are many records of performances, as well as of names of puppeteers. Glove-rod puppets, a glove puppet worn on the hand with rods to effect arm and hand movements, combine the excellencies of both types.

Puppetry is universal. Different countries have their individual types of puppet theatre in which their legends, fairy tales, and folklore are staged. There is an enormous literature on the subject. In Great Britain there is an association, the British Model Theatre

and Puppet Guild, founded in 1925, whose activities include the publication of an illustrated quarterly *The Puppet Master*, an annual exhibition staged in London, and the development of puppetry as an aid to education. The guild has a lending library. See Marionette; Punch and Judy illus.

Bibliography. Penny Plain, Two-pence Coloured, A. E. Wilson, 1932; Dolls and Puppets, M. von Boehn, Eng. trans., 1932; Puppetry for School and Home, H. W. Whanslaw, 1936; Puppets and the Puppet Stage, C. W. Beaumont, 1938; Hand and String Puppets, W. S. Lancaster, 1943; The Puppet Theatre, J. Bussell, 1946; Wooden Stars, D. Fisher, 1947.

Puppet State. Term used from the 1930s to describe a country whose affairs were known to be controlled by another, although it was ostensibly independent. The classic example was Manchuria, where the Japanese, after seizing the territory from China, installed an emperor. By extension the terms puppet king, puppet premier, and puppet government came in during the Second Great War.

Puranas, THE. Scriptures on which Hinduism is based. The principal Puranas are 18 in number and there are also 18 secondary ones or Upapuranas. Traditionally said to be the works of the compiler of the Vedas, they are of a later period, and, according to Elphinstone (*History of India*), were composed by different authors between the 8th and 16th centuries. They include accounts of the Creation, philosophical speculations, instructions for religious ceremonies, genealogies, fragments of history, and legends of the actions of gods, heroes, and sages.

Purbeck, ISLE OF. Really a peninsula, in the S.E. of Dorset, England. It is bounded N. by the river Frome and Poole Harbour, and W. rather indifferently by streams. It measures about 8 m. N. to S. and 12 m. E. to W., and is crossed E.-W. by a range of chalk hills which rise in Creech Barrow to 660 ft. Downs and heath contribute to the beautiful scenery. Once a deer forest, the "isle" is now noted for its quarries of freshwater limestone known as Purbeck marble, and for china clay. The village of Corfe Castle dozes in the centre, and on the S.E. coast is Swanage. The westernmost third of the area was enclosed for military training during and after the Second Great War.

Purbeck Beds. In geology, name given to the rocks formed at the end of the Jurassic epoch.

They are clays, limestones, shales, marls, and the so-called dirt beds. They are chiefly fresh-water deposits, though containing many marine fossils. In the Purbeck beds have been found remains of dinosaurs, crocodiles, plesiosaurs, shells of many fresh-water mollusca, etc. The Purbeck rocks are named from Purbeck, whence they extend uninterruptedly to Aylesbury, and appear scattered in other counties. The series is famous for Purbeck marbles, and for building and paving stones. *See* Jurassic.

Purcell, HENRY (c. 1658-95). English composer. He is said to have been born in Little St. Anne's

Henry Purcell,
English composer

Lane, Westminster, and was the son of the master of the Abbeychoristers. Henry sang at the Chapel Royal and learned composition from Blow, whom he succeeded in 1679 as organist of Westminster Abbey. He had already set music to a masque included in Shadwell's adaptation of Timon of Athens. From 1682 he also held the post of organist to the Chapel Royal. Next year he published a set of sonatas, composed the first of a series of odes for S. Cecilia's day, and began his interest in anthems. Music for Dryden's Tyrannic Love and songs for D'Urfey's The Fool's Preferment followed in 1686-88.

Then Purcell produced one of the masterpieces of music-drama, Dido and Aeneas, the earliest opera in English entirely without speech; the date of first performance is unknown. In 1690 he contributed songs to Dryden's arrangement of The Tempest; in 1691 collaborated with him in King Arthur. Of The Fairy Queen, 1692, the full score was not discovered till 1901. More festival music included a magnificent Te Deum and Jubilate in 1694, and a beautiful funeral service was written for Queen Mary II. The song, From Rosie Bowrs, was apparently the last work of Purcell, who died Nov. 21, 1695.

Purcell's reputation has never been challenged as the greatest English-born composer. Into an era when elaborate madrigals imitated from abroad were the fashion, he introduced simplicity, originality, and the art of finding the exact musical equivalent for

every mood from joviality to sorrow. In melodic beauty Handel scarcely surpasses him; he is the supreme master of the ground-bass in song form. The marching song Lilliburlero has been attributed to Purcell, but the Trumpet Voluntary is now assigned to Jeremiah Clarke. Among his anthems are They that Go Down to the Sea in Ships; My Heart Is Inditing; Rejoice in the Lord. His vocal music, like his fantasias, chaconnes, sonatas, voluntaries, etc., awaits a complete catalogue. His Life has been written by W. H. Cummings, 1881; D. Arundell, 1928; A. K. Holland, 1932.

Purchas, SAMUEL (c. 1575-1626). English author. Born at Thaxted, Essex, he graduated at St. John's College, Cambridge, and taking orders, became curate of Purleigh, 1601, and vicar of Eastwood, 1604-13. From 1614 he was rector of St. Martin's, Ludgate Hill, and during this period, from many of Hakluyt's MSS, which he had inherited, he compiled Hakluytus Posthumus, or Purchas his Pilgrimes, containing a History of the World in Sea Voyages and Land-Travells by Englishmen and others, 1625. He also wrote Purchas his Pilgrimage, or Relations of the World and the Religions observed in all Ages and Places, etc., 1613; and Purchas his Pilgrim: Microcosmus, or the History of Man, 1619. *Pron.* Purkas.

Purchase. Literally, to obtain by payment. In a special sense the word is used for the system by which commissions in the British army were bought and sold. The practice also prevailed in other armies. In 1871 the proposal of the government to abolish purchase was bitterly opposed in the house of lords. It was, therefore, ended by a royal warrant.

Purchase Tax. Tax introduced by the British govt. as a war measure and first levied on Oct. 21, 1940. The tax was imposed on retail sales of consumer goods with the object of restricting purchases of luxuries and diverting money to national savings and labour to war industries. Food and fuel were exempt, and the tax was graded according to the necessity of the article taxed, reaching a maximum of 100 p.c. After the war, it was progressively reduced on a few articles, abolished on others, but retained on many. The tax is collected through wholesalers who add it to the cost of goods supplied to retailers. The estimated yield for 1950-51 was £295,000,000.

Purchasing Power. A term used in economics to denote the capacity to buy goods and services. The purchasing power of an individual depends on (a) the amount of money possessed, or (b) the ability to acquire money without delay by borrowing, by selling "marketable" things, or in other ways, and (c) the level of prices. When prices generally rise, the purchasing power of those possessing money decreases, as does that of those having rights to receive money. Conversely, when prices fall, the purchasing power of employees, creditors, lenders, etc., increases. The purchasing power of money wages is sometimes termed real wages. Changes in wage-rates tend to lag behind changes in prices.

The purchasing power of a country abroad depends partly on rates of exchange, and partly on the terms of trade, i.e. the relative difference in the prices at which goods are imported and exported. During and after the Second Great War there was in the U.K. a considerable change in the distribution of purchasing power, principally because of the very heavy taxation of large incomes and estates, and because of marked rises in the rates of wages of many classes of manual workers.

Purfleet. A village of Essex, England. It stands on the Thames. 16 m. by rly. E. of London. There have been government powder magazines here since 1781. The harbour has wharves for the landing and storing of goods, and there are oil storage tanks. Pop. 8,511.

Purgative. Substance which promotes evacuation of the bowel. Such substances may be divided into: laxatives or drugs which act as mild stimulants to the muscular coat of the intestine, such as magnesia, olive oil, castor-oil in small doses, honey, figs, prunes, and other fruits; simple purgatives, which stimulate secretion as well as promote muscular movements, and are more powerful in their action than laxatives, the commoner simple purgatives being aloes, rhubarb, cascara sagrada, senna, and castor-oil: drastic purgatives, which strongly stimulate secretion and peristaltic movements of the intestine, such as calomel, podophyllin, scammony, colocynth, and croton oil; and saline purgatives, which largely increase the passage of fluid from the tissues into the intestine. Saline purgatives are the essential constituents of many medicinal waters. A mild laxative at

night and a mild saline on rising make a wise answer to the threat of constipation.

Purgatory (Lat. *purgatorium*, that which cleanses). Theological term for a state of purification through which the souls of the redeemed who die before attaining perfection are held to pass. The doctrine was gradually developed, and is nowhere directly taught in the Bible (see Luke 23, v. 43), the texts adduced being capable of other interpretations. It is, implied in 2 Macc. 12, vv. 41 ff.

The allusions in the Fathers before S. Augustine are vague. S. Gregory the Great was the first to define the doctrine, A.D. 604. The Eastern Church has generally maintained the existence of a purgatorial state, though denying that it is accompanied by pains beyond the pangs of conscience. The Roman Catholic Church declares that, as death does not in itself cause sanctification, those who, although saved from eternal punishment, die without having made satisfaction for their sins by the fruits of repentance, require to be purified thereafter by punishments. The pains of purgatory, represented as purging fires, are graduated accordingly, and can be mitigated or shortened by the prayers and alms of the faithful, and especially by the Mass.

The council of Trent, while formulating the Roman Catholic doctrine of purgatory, denounced abuses and superstitions connected with it. The Reformers generally denied the doctrine altogether, as it conflicted with their teaching on the Atonement and justification by faith. The Church of England, in the 22nd Article, condemns "the Romish doctrine concerning purgatory."

Among imaginative descriptions of purgatory by far the greatest is the second part of Dante's *Divine Comedy*. He represents it as an island in the Southern hemisphere, rising by seven stages, corresponding to the seven deadly sins, to the earthly paradise. See *Eschatology*; Heaven; Hell; Indulgence; Limbus.

Puri. District and seaside town of Orissa, India. It is 310 m. by rly. S. of Calcutta, on the bay of Bengal, and is the summer headquarters of the Orissa government. Steamers call at Puri only occasionally as there is no safe anchorage or landing place. It is probably the ancient Dautpura, where Buddha's tooth was housed before being sent to Ceylon. The town includes the sacred precincts

of Parushottama, in the centre being the temple or Sri Mandir containing the shrine of Jagannath

Puri, India. The temple of Juggernaut, where the Hindu idol is kept

or Juggernaut (*q.v.*), which is said to date from A.D. 318. The festival of Jagannath's car is attended annually by a huge number of pilgrims. The museum at Puri is much visited by antiquarians and scholars. The district is mostly flat, and it includes the rivers Bhargavi, Daya, and Nun, which flow into the Chilka lake and are navigable during the rainy season. The town is popular as a watering-place, though bathing is dangerous owing to strong currents. Area 2,451 sq. m. Pop., district, 1,101,939; town, 43,614.

Purification of the Blessed Virgin Mary. Festival observed by the Greek, Roman, Anglican, and other churches on Feb. 2, alternatively called in the Prayer Book the Presentation of Christ in the Temple, it commemorates the ceremonial visit of Joseph, the Virgin, and the infant Christ to the Temple, recorded in Luke 2, vv. 22-39. Lev. 12 prescribes the rites, including the offering of a lamb and pigeon, or two pigeons, which concluded the 40 days' ceremonial uncleanness of a woman after the birth of a male child. The Christian festival, recorded at Jerusalem about 450, was introduced in Rome by Pope Gelasius in 494, in place of the pagan Lupercalia. The English name Candlemas alludes to the words of Simeon, Luke 2, v. 32. See *Mary*.

Purim. Jewish festival celebrating the escape of the Jews from the plot of Haman (*q.v.*). Held on the 14 and 15 Adar, about a month before the Christian Easter, the festivities resemble those of Christmas, including present giving, feasting, and merrymaking,

and the performance of religious plays. Formerly an effigy of Haman was carried in procession and finally hanged and burned.

Purine (Lat. *pus, puris, pus*). Fundamental compounds of the uric acid group of organic chemicals. Purine can be prepared by converting uric acid into trichloropurine by means of phosphorus oxychloride, and this yields successively di-iodopurine and purine when treated with iodic acid and zinc dust. Purine has been prepared synthetically. Purine-like substances are known as the purine bases and include uric acid and xanthine, which are found in animal secretions.

Puritans. Name primarily applied in the 16th century to those advanced Protestants among the clergy who wished to purify the Church of England from what they regarded as superstitious and corrupt observances retained after the severance from Rome. From the clergy it spread to their supporters among the laity, and then was applied more particularly to the sectaries who stood outside the Church altogether. Generally, though not necessarily, their doctrines were Calvinistic.

Since the government of the Stuarts was especially repressive towards Puritanism, parliamentary opposition to the crown found in them its strongest supporters, and they claimed to be the champions of religious liberty. Of Puritanism in its best signification Milton, Cromwell, and Bunyan are the supreme types. The Puritans, however, included both tolerationists like Cromwell, and men whose idea of religious liberty was liberty for themselves and the enforcement of their own opinions upon their neighbours. The harshness and rigidity of many of the doctrines most in favour with them, and in especial their view that it was the business of the state to supervise the personal morality of the citizens, caused a severe reaction against the Puritan predominance, and after the Stuart restoration in 1660 the name of Puritan was held up to derision by such satirists as Butler. The New England states of North America were for many years a Puritan stronghold. See *Calvinism*; *Non-conformity*.

Bibliography. English Puritanism and its Leaders, J. Tulloch, 1861; Puritanism in the Old World and in the New, J. Gregory, 1895; The Puritans in England and New England, E. H. Byington, 1896; The Church and the Puritans, H. O. Wakeman, 6th ed., 1902; The First

Two Stuarts and the Puritan Revolution, S. R. Gardiner, 1902; Puritanism in England, H. H. Henson, 1912; The Puritans and Music, P. A. Scholes, 1934; A Puritan Church, O. E. Maures, 1938.

Purl. Hot alcoholic beverage. It is compounded of beer or ale, milk, spirits, sugar, and spice. The spirit may be gin, rum, or brandy; the milk may be omitted and ginger used, but the liquor must be brought almost to boiling point and the ingredients well mixed.

Purley. Residential suburb of London. In Surrey, it forms with Coudon an urban district, and has rly. stations, a tram terminus, and also Green Line connexion with the capital, from which it is 13 m. S. Purley Way is part of the Croydon by-pass on the Brighton road. Riddlesdown is a comparatively rural part.

Purlin. In carpentry, a horizontal beam placed above and secured to the principal rafters of a roof (*q.v.*) along the latter's whole length. It serves to support any weight imposed upon the roof.

Purnea OR **PURNIAH.** Dist. and town of Bihar, India, in the Bhagalpur division. The dist. lies N. of the Ganges, S. of Nepal, and E. of the river Kosi or Kusi. Only two-thirds of the area is cultivated. Paddy fields cover three-fifths of the tilled area. The town, on a branch rly. N. from Katihar, was once a Mahomedan capital. Area of dist., 4,998 sq. m. Pop., dist., 2,390,105; town, 17,500.

Purple (Gr. *porphyra*, purple-fish). Colour intermediate between crimson and violet. In classical antiquity the word denoted the fast purple dye resulting from the exposure to sunlight of a yellowish liquid secreted by whelk-like molluscs of the genera *Purpura* and *Murex*. It is chemically a dibromo-indigotin. Purple robes commanded high prices, and under the Roman emperors were limited to imperial use, hence the phrase born in the purple. The dye was imported into ancient Egypt, and many Biblical references illustrate its importance. It was also used for mural painting, ink, face-rouge, and for staining vellum inscribed in gold.

Purple Emperor (*Apatura iris*). One of the finest British butterflies. Although abundant in Central Europe, it is confined in England to favoured localities in the S., where it is generally uncommon. The caterpillar feeds on swallow, but the butterfly inhabits woodlands, chiefly of oak. It flies swiftly, but may descend to

feed on the juices of carrion, or at foul puddles or exuding sap. Such occasions afford the collector his only chance of capturing the insect. Its large size, deep brown-black colour, banded and spotted with white, make it conspicuous and, in the male, the wings have a beautiful purple iridescence.

Purple Heart. Military decoration of the U.S.A. Instituted by Washington in 1781, it was the first medal for conspicuous military service awarded by the U.S. govt., but after the War of Independence passed into disuse, having been granted on only three occasions. It was revived on Feb. 22, 1932, the bicentenary of Washington's birth. During the Second Great War, it was granted to all military and naval personnel wounded in action under conditions entitling the wearing of a wound stripe. The decoration consists of a heart-shaped medal: on the obverse is a bust of Washington on a purple ground; the bronze reverse carries the inscription For Military Merit. It is attached to a purple ribbon bordered with white by a ring incorporating the Washington family arms.

Purple Light. Phenomenon seen in the western sky soon after sunset. It is an arch-shaped glow of colour, varying from pink to violet, which appears in the western sky at a considerable altitude above the point at which the sun has set. Maximum brilliance is reached when the sun is about 4° below the horizon; then white buildings in the east have a purple glow. The effect is due to diffraction of sunlight by dust particles. See Diffraction.

Purple of Cassius. Purple precipitate formed by adding a solution of stannous and stannic chloride to a dilute solution of gold chloride. First prepared by Andreas Cassius of Hamburg, about 1683, it was described in a pamphlet by his son of the same name. Much discussion has taken place as to the original composition, the modern view being that it is a mixture of colloidal gold and colloidal stannic acid. Its chief use is for preparing ruby glass. The formation of the coloured precipitate is extremely sensitive; it has been said that one part of gold in 100 million parts of solution can be detected. The depth of colour produced is proportional to the amount of gold present, and a quantitative method has been developed for determining the gold content of cyanide solutions.

Purple-wort OR **MARSH CINQUE-FOIL** (*Comarum palustre*). Perennial herb of the family Rosaceae,

Purple-wort. Foliage and flowers

a native of Europe (including Great Britain), N. Asia, and N. America. Upon a long, woody rootstock rise tall stems of purple-brown tint. The leaves are divided into five or seven leaflets with toothed edges. The sparse flowers have short, dark purple-brown petals and larger sepals which are purple on the inner face. The root-stock is an astringent, and a yellow dye is obtained from it. It is also known as *Potentilla palustris*.

Purpura. Red or purple patches of the skin due to haemorrhage from the superficial blood-vessels. It is a symptom of a large number of diseases, including cerebrospinal meningitis, smallpox, and scurvy, and may follow the administration of certain drugs; or may be associated with rheumatism.

Purpura. Genus of marine gastropods. *P. lapillus*, the dog whelk, sometimes called the dog winkle, swarms on the rocks around the British coasts, resembles in form a small whelk, and has a whitish shell with spiral bandings. Chiefly found on the rocks between tide marks, it is carnivorous in habit, feeding mainly on mussels, and is destructive in oyster beds, drilling holes through the shell with its radula and extracting the inmate. It derives its scientific name from the secretion of an indelible purple dye from a gland behind the head. See Gastropoda; Mollusca.

Purple. One of the tinctures in heraldry. It is represented in drawings by thin diagonal lines from sinister chief to dexter base. See Heraldry; Tincture.

Purser (corruption of bursar). Former commissioned rank in the Royal Navy. The purser kept the accounts of a warship and had charge of the provisioning,

clothing, and payment of the crew. The rank was abolished in 1850 and replaced by that of paymaster. Passenger and cargo liners of the merchant navy carry pursers who rank as officers and act as business managers of the ship. They look after valuables, have authority to alter cabin allocations, stage-manage entertainments, and keep the ship's accounts.

Purslane (*Portulacaceae*). Family of succulent herbs of wide distribution but particularly found in N. and S. America. *Claytonia perfoliata*, with white, notched petals and numerous stems having one leaf below the flower clusters, is a common English weed. *Montia fontana* is blinks or water chickweed.

Sea purslane (*Arenaria peploides*) has a creeping rootstock, short, forked flower stems, fleshy leaves, and few flowers. Water purslane (*Peplis portula*), found in wet places throughout England and Ireland, is a small creeping annual with sessile flowers in the axils of the leaves. These latter plants do not belong to the purslane family; sea purslane is a member of Caryophyllaceae, and water purslane of hythraceae.

Pursuivant (Fr. *poursuivant*, attendant). Title of the junior officers of arms. Formerly they were the messengers and executive officers of the earl marshal's court, as well as the assistants and secretaries of the heralds. They derive their individual titles from honoured badges and other insignia. The pursuivants of the Heralds' College are Bluemantle, instituted by Edward III as an extra officer to the Order of the Garter; Rouge Croix in allusion to the cross of S. George; Rouge Dragon and Portcullis, both instituted by Henry VII, in allusion to the Welsh dragon of the Tudors and the Beaufort badge which had come to their house by alliance. Pursuivants, like heralds, wear tabards. The Scottish pursuivants are named Dingwall, Unicorn, and Carrick. See Herald; Tabard.

Purulia. Town of Bihar, India, in Manbhum dist. It is the headquarters of the dist. and a rly. junction for Ranchi, Asansol and Jamshedpur. Pop. 24,000.

Purús. River of S. America, a tributary of the Amazon. Rising in La Montaña, E. Peru, it enters Brazil through Acre Territory and flows N.E. across the state of Amazonas to join the Amazon through a large delta, about 120 m. above Manaus. Its length is estimated to be about 1,850 m. Sluggish and

extraordinarily winding, it is navigable for steamers for 1,850 m.

Purveyance (Lat. *providere*, to provide). The right claimed by English and other kings to requisition, when travelling through the country, whatever was needed by themselves and their retinue in the way of provisions and services. This right, which appears to have been exercised from the earliest times, was naturally liable to great abuses. The grievance was dealt with in Magna Carta, and was the subject of much legislation from Edward I's time, but was not abolished until 1660. See Royal Household.

Pus. Collection of dead, white blood corpuscles, resulting from inflammation. See Inflammation; Suppuration.

Pusey, EDWARD BOUVERIE (1800-82). British divine. Born at Pusey, Berks, Aug. 22, 1800,

Edward Pusey,
British divine

he was a son of Jacob Bouverie (a son of the 1st Viscount Folkestone), who took the additional name of Pusey on succeeding to estates there. Educated at Eton and Christ Church, Oxford,

Edward became a fellow of Oriel College, was ordained, and studied Biblical criticism, and oriental languages at German universities. He made a reputation as a theologian, and in 1828 was elected professor of Hebrew at Oxford and canon of Christ Church. Pusey gave much time to studying the usages of the Church in the past, and in a series of sermons laid down the principles on which the High Church movement was founded, while he contributed to Tracts for the Times. For a sermon preached in Oxford, May 14, 1843, he was suspended from preaching for two years. But the movement was widely successful, and from its inception Pusey was its acknowledged head, remaining its guide until his death in Oxford, Sept. 16, 1882. His writings include *Doctrine of the Real Presence*, 1865. Pusey House, a theological centre in Oxford, is a memorial of his life and work. See Oxford Movement; *consult* Lives, G. W. E. Russell, 1907; L. Prestige, 1933.

Push-Ball. Game invented by M. G. Crane, of Massachusetts, in 1894. It was introduced into Great Britain a few years later but never became popular. There are two sides of 11 players each,

divided into forwards, right wings, left wings, and goalkeeper. The goalposts are 18 ft. high and 20 ft. apart, with a crossbar 7 ft. from the ground. The ball used is 6 ft. in diameter, and weighs 50 lb. The playing area measures 140 yds. by 50 yds. Pushing the ball under the bar counts five points, and eight points are scored if it is thrown over the crossbar. A type of push-ball has been played at military tournaments in the U.K.

Pushkin, ALEXANDER SERGËEVITCH (1799-1837). Russian poet. He was born at Pskov, May 26,

1799. His father was a member of an old noble family, and his mother a granddaughter of Abraham Petrovitch Hannibal, the negro favourite of Peter the Great. He was educated at the lyceum at Tsarskoe Selo, and was early noted for his mastery of languages. His first poems were published when he was fifteen, and he entered the civil service in 1817.

In 1820 his fairy-tale poem, *Ruslan and Ludmilla*, gave him immediate fame, but in the same year he was banished to Bessarabia on account of his Ode to Liberty, circulated in MS. Visiting the Caucasus, he found inspiration for much fresh work, notably *The Prisoner of the Caucasus*, 1822. In 1824 an intercepted letter, in which he spoke slightly of religion, caused his banishment to his father's estate in the prov. of Pskov, and there in two years he wrote much of his best work, including a large part of the autobiographic poem, *Eugene Onegin*, and his great tragedy, *Boris Godunov*, 1825. In 1826 he was allowed to return to St. Petersburg. Poltava, 1828, was a fine narrative poem.

Appointed historiographer to the crown, he wrote a *History of the Revolt of Pugachev*, 1833, and a short novel of the same period, *The Captain's Daughter*, 1836. He was wounded in a duel, Jan. 27, 1837, and died two days later. During his short life Pushkin wrote much, despite a fondness for society and periods of dissipation; and he occupies one of the highest positions in Russian literature, continuing to enjoy popularity after the Revolution. *Consult* Pushkin, E. J. Simmons, 1937;

Pushkin and Russian Literature, J. Lavrin, 1947.

Pushkin. A town of the R.S.F.S.R., 15 m. S. of Leningrad and in that region. Originally called Detskoe Selo (children's village), it became the summer residence of the imperial family in the reign of Catherine the Great, who renamed it Tsarskoe Selo; after the revolution of 1917 it was called after the great writer (*v.s.*). The town contained two imperial palaces, the larger 800 ft. long and surrounded by parkland. It was noted for its lavishly decorated apartments and works of art. Pushkin was captured by the Germans during their advance on Leningrad in July, 1941, and retaken by the Soviet army on Jan. 24, 1944. Before withdrawing, the Germans devastated the town and deported the inhabitants to Germany.

Pushtu or Pashto. Language spoken by the Pathan peoples of the North-West Frontier province of Pakistan, Baluchistan, and Afghanistan E. of the Helmund. It is essentially Iranian, with an admixture of Indo-Aryan words. The N.E. or hard Pukhtu dialect of Peshawar is allied to sub-dialects in Buner, Swat, and Bajaur, and to those of the Yusufzai, Orakzai, Ghilzai, Mohmands, and Afridi. The S.W. or soft Pushtu dialect is also highly differentiated, in Bannu, Waziristan, and Kandahar. The literature, traceable back to the 15th century, embraces history and ballad poetry. *See* Iranian; Pathan.

Pussyfoot. Nickname given to the advocate of prohibition, W. E. Johnson (*q.v.*), probably from his silent methods of tracking down offenders against the law, when engaged in suppressing the liquor trade in Indian territory.

Pussy Willow. Popular name for the tree *Salix caprea* described under Sallow.

Pusztas. Temperate grasslands of the Hungarian plains. Formerly almost entirely devoted to stock-rearing, the pusztas have now become one of the chief wheat-producing regions of Europe. Hungarian wheat and flour are among the finest in the world. Horse-rearing is an occupation in the drier parts. *See* Alföld; Steppe.

Putlog or Putlock. Horizontal piece of timber inserted into holes in masonry for the purpose of supporting timber. *See* Scaffolding.

Putnam, GEORGE HAVEN (1844-1930). American author and publisher. Born in London, April 2, 1844, he was educated at Columbia grammar school, New York, the

Sorbonne, Paris, and Göttingen university. He served in the 176th New York cavalry during the Civil War, and was a prisoner at Libby and Danville, 1864-65. President of G. P. Putnam's Sons, publishers, he did much to promote the American copyright bill of 1891. His books include *Authors and Publishers*, 1883; *The Question of Copyright*, 1891; *Abraham Lincoln*, 1909; and two volumes of *Memories*, 1914 and 1915. Putnam died Feb. 27, 1930.

Putnam, GEORGE PALMER (1887-1950). American publisher and writer. Born at Rye, N.Y., Sept. 7, 1887, and educated at Harvard and California universities, he became director of G. P. Putnam's Sons and president of the Knickerbocker Press 1919-30. Director of

the American museum of natural history expedition to Greenland, 1926, and of an expedition to Baffin Island the following year, he served in the U.S. army air force

during the Second Great War. He married Amelia Earhart (*q.v.*), the aviator, of whom he wrote a biography, *Soaring Wings*, in 1940. His other publications included *The Southland of N. America*, 1913; *Wide Margins*, 1942; *Duration*, 1943. He died Jan. 4, 1950.

Putney. London suburb. Situated on the Thames, S. of Fulham, and in the co. of Surrey, it forms part of the met. bor. of Wandsworth, and is included in the bor. constituency of Wandsworth (Putney). It is connected with the City and West End by rly., underground rlys., bus, and river transport. The parish church of St. Mary has a 14th-century tower, restored when

the church was rebuilt in 1836, and a fine chantry, N. of the chancel, built by Bishop West in 1533. The bridge, by Bazalgette, 1886, replaced a wooden structure which, in 1729, superseded an ancient ferry. It was greatly widened in 1933. Putney is the headquarters of many rowing clubs and the starting-point of the Oxford and Cambridge boat race. A pier for river passenger service was built in 1948. A public library was the gift of Sir George Newnes. The Royal Hospital for Incurables dates from 1854. On Putney Heath, which adjoins Wimbledon Common, are reservoirs of the Chelsea water-works.

At Putney, called Putelei in Domesday, and included in the manor of Wimbledon, Harold had a fishery. Elizabeth was a frequent visitor at Putney Palace, the residence near the river of John Lacy. Notable residents have included Thomas Cromwell, Gibbon, Mrs. Siddons, William Pitt, Swinburne, Watts-Dunton, Sir George Newnes, J. P. Morgan, and, during his Nazi-enforced exile, President Eduard Benes, of Czecho-Slovakia. Clement Attlee was born here. Putney Heath, once notable as a duelling centre, had during 1690-1750 the most famous bowling green near London.

Putney, London. The High Street, and, left, the 14th cent. tower of the parish church of St. Mary

Putney suffered little damage in the earlier air raids of the Second Great War, but many houses, shops, and churches were destroyed in 1944, particularly by flying bombs. On Nov. 7, 1943, a single bomb dropped by a lone German raider caused one of the most calamitous "incidents" of the war, falling on a dance-hall over a milk bar, and close to bus queues as people emerged from cinemas. Over 80 were killed and many more injured. Pop. 70,835.

Putrefaction. Changes which occur in organic matter after death. They result from the action of bacteria upon simple substances, and in their course foul smells and

poisonous material are produced. See Decomposition.

Putsch. Swiss dialect word meaning push or thrust; originally a shower. It is now internationally accepted for an unexpected revolt of limited size and with the employment of force. Examples have been frequent in Latin America, and European ones include the ousting of the Stambolisky dictatorship in Bulgaria, 1923; the Kapp putsch of 1920 which tried to overthrow the Weimar republic by the seizure of Berlin; and the Hitler putsch of 1923 at Munich.

Puttee (Hindi *patti*, bandage). Long strip of cloth used as a leg covering. About 3 yds. long and

Puttee, as formerly worn by infantry

4 ins. wide, the puttee is wound spirally round the leg between knee and ankle, drawn tight, and secured with tapes. First used in the Indian army, it was adopted as part of the khaki service uniform of British troops.

For cavalry the puttee was wound downwards and the tapes secured at the ankle; for infantry it was wound upwards and tied below the knee. In 1937 the British and Indian armies abolished the puttee with the introduction of battledress, replacing it with the canvas anklet. A short puttee was retained for kilted regiments.

Putter. Shortest golf club. Designed for use on the green, it has a straight face and is used to propel the ball into the hole from a distance of anything between 20 yards and one inch. Putters vary considerably in shape, from the putting cleek to those with a comparatively massive wooden or aluminium head. See Golf.

Putting the weight or shot. An event included in the programme of most athletic meetings. According to A.A.A. rules, a competitor must stand within a 7 ft. square to cast the shot or iron ball, which should weigh exactly 16 lb. The shot must be "put" by a

fair push from the shoulder, not thrown. Length of the put is calculated from the front line of the square to the spot where the weight pitches. In America the putter stands within a 7 ft. circle, the rim of which is raised to prevent overstepping. The amateur world record was made by C. Fonville, of the U.S.A., with 58 ft. 0½ in., in 1948. The Olympic Games record, by W. M. Thompson, of the U.S.A., 1948, was 56 ft. 2 in.

Putty. Plastic mixture of fine dry whiting or powdered chalk and linseed oil and usually white lead. It is used by glaziers for fixing window panes, and by painters for stopping nail holes and crevices and irregularities in woodwork. Plasterers' putty, or lime putty, consists of pure lime slaked with water until a creamy liquid is formed. After being sieved the mixture is allowed to stand for six weeks to several months, and is then used as a final coat in plastering walls, etc.

Pu Tu or Pootoo. Narrow island, lying 1½ m. E. of Chusan Island in the China Sea. It is 3½ m. long, and only half a mile wide at its narrowest part. The island is consecrated to the Bodhisattva Avalokiteçvara (Chinese, Kuan Yin) or goddess of mercy, the guardian deity of sailors. Pu Tu is one of the most celebrated centres of Buddhism, and is visited by thousands of pilgrims from China, Japan, and Korea. Its fame dates back to 858, when a Japanese monk founded a temple here.

Putumayo. Unorganized territory (commissary) and river of Colombia, S. America. It borders on Ecuador, and is in part claimed by that republic and Peru, but its boundaries are not yet defined. It is named from the river Putumayo or Iço, which traverses it. The capital is Mocoa. One estimate of the area is 10,220 sq. m. Pop. 15,688. The river rises near Pasto in Colombia, flows E. by S., and unites with the Amazon near São Antonio. It is navigable for small craft for 700 m.

Putumayo Atrocities. Name given to a series of offences in the Putumayo district of Peru, near

the Colombian frontier. In 1909 allegations were made by an English writer of gross ill-treatment of native labourers in rubber plantations owned by the Peruvian Amazon Company, a British enterprise formed in 1907. An official inquiry was made by Roger Casement (q.v.) under British government orders. His report described the existence of systematic atrocities of a revolting kind, and action by Great Britain and the U.S.A. brought the punishment of some offenders by the Peruvian government.

Puvis de Chavannes, PIERRE CÉCILE (1824-98). French painter.

Born at Lyons, Dec. 14, 1824, he studied engineering, but a visit to Italy determined him to adopt an art career. He studied under Henri Scheffer, De. lacroix, and Couture, but developed a wholly original decorative style of his own, especially in mural painting. No recognition was given to him till 1861, when his two canvases, War and Peace, were bought for the state. In 1876-77 he decorated the Panthéon

P. Puvis de Chavannes, French painter

Puvis de Chavannes. An Allegory, by this French painter, famous especially for his frescoes

(Paris) with paintings of the childhood of S. Geneviève, and in 1886-88 completed his great Hemicycle at the Sorbonne. The Marseilles, Amiens, Rouen, and Lyons museums were all adorned with his flat-toned frescoes on canvas. The Poor Fisherman, one of his few easel pictures, is in the Louvre. He died Oct. 24, 1898.

Puy de Dôme. Department of France. In the centre of the country, its area is 3,090 sq. m. It is a mountainous region, with many extinct volcanoes, the craters of

Putting the Weight. An Oxford athlete about to cast the shot

which are rich in oil, lead, and granite. The chief rivers are the Allier, Cher, Dore, and Dordogne, and the highest peak is the Puy de Sancy (6,188 ft.). The Puy de Dôme itself is 4,800 ft. high. In the department fruit, rye, and potatoes are grown, and there are vineyards, its most fertile part being the plain of Limagne. The department has valuable coal mines and a number of mineral springs. Clermont-Ferrand is the capital and much the biggest place; other towns are Riom and Issoire. Before the Revolution the department was included in Auvergne, Bourbonnais, and Lyonnais. Population 478,732.

Pu Yi, HENRY (b. 1906). Former emperor of Manchukuo. Son of Prince Chun, he succeeded to the throne of the Chinese empire in 1909, reigning as Hsuan Tung, but was de-throned by the revolution of 1911. Replaced for a week by a monarchial coup in 1917,

Henry Pu Yi,
Emperor of Man-
chukuo

he was expelled from Peiping in 1924 when the city was occupied by Feng Yu-hsiang, and took refuge in the Japanese legation. He later escaped to Tientsin. In 1932 he was set up by the Japanese as head of the puppet state of Manchukuo (Manchuria), and was enthroned in 1934 as the emperor Kang Teh. With the Japanese defeat in the Second Great War he was arrested by the Russians at Mukden and interned.

Puymorens Tunnel. Tunnel of the Pyrenees on the direct route between Toulouse and Barcelona. The Col de Puymorens, 6,295 ft., is on the watershed between the valley of the Ariège in France and that of the Segre in Spain. By an agreement between France and Spain, made in 1907, a rly. was to be constructed on this route; the most formidable engineering work was the cutting of the Puymorens Tunnel, which is perfectly straight, $3\frac{1}{2}$ m. long, $14\frac{1}{2}$ ft. wide, and 18 ft. high. The engineers, working S. from L'Hospitalet and N. from Porté, met on Dec. 24, 1914.

Puzzle (Mid. Eng. *opsaile*, question). Question or contrivance to perplex the mind. It may be a perplexing question; an arrangement of letters or words, inviting solution (e.g. an acrostic, anagram, etc.); or a toy or device

of wood, metal, or other material, which has some intricate way of being arranged, fastened, or unfastened. Examples of these last are the Chinese Tangram, one of the first contrivances to be called a puzzle, which consisted of a square piece of wood dissected into geometrical pieces that could be arranged so as to form a huge number of figures; and the Chinese rings linked on to a bar that had to be detached and replaced. See Crossword; Jig-Saw; Maze.

Pwllheli. Mun. borough, seaport, and market town of Carnarvonshire, Wales. It stands on Tremado Bay, at the N. side of Cardigan Bay, 21 m. S.S.W. of Carnarvon, and is served by rly. It has a good harbour, is a centre of the crab and lobster fisheries, and has a small fishing fleet. Lead, copper, and manganese are found in the neighbourhood. There are excellent sands, good bathing, and a large holiday camp. Near the town much land has been reclaimed from the sea. Pwllheli, the name meaning salt pool, became a borough in the 13th cent. Market day, Wed. Pop. 4,200.

Pyaemia (Gr. *pyon*, pus; *haima*, blood). Form of blood poisoning (*q.v.*) in which micro-organisms in the circulation cause abscesses to appear in various parts of the body. Penicillin and the sulphonamides have proved helpful.

Pyapon. Dist. and town of Burma, in the Irawadi division. The dist. occupies 2,148 sq. m. in the E. portion of the Irawadi delta. Rice is the sole crop. The town is situated some miles from the coast and the river channels. Pop., dist., 385,008; town, 10,000.

Pyatigorsk. Town of the N. Caucasian area of the R.S.F.S.R. It is on the river Podkumok, and on a branch of the Vladikavkaz rly., and is famous for sulphur springs. Mt. Elbruz, 60 m. distant, may be seen from the square. During the Second Great War the town was recaptured by the Russians, Jan. 11, 1943, after being in German possession since Aug. 24, 1942. Pop. 62,875.

Pydna, BATTLE OF. Fought in 168 B.C., at the town of that name in Macedonia, between the Romans under L. Aemilius Paulus, and a Greek army under Perseus, last king of Macedonia. The battle is memorable in military history for the final triumph of the loose formation of the Roman legionaries armed with short swords over the phalanx (*q.v.*) of spearmen.

Pye, HENRY JAMES (1745-1813). British poet laureate. The son of

Henry Pye, M.P., of Faringdon, he was born in London, Feb. 20, 1745, and educated at Magdalen College, Oxford. In 1766 he inherited his father's estate, but so heavily was it encumbered that soon after his own election as M.P. for Berkshire in 1784 he was obliged to sell it. He retired from parliament in 1790, and in that year succeeded Warton as poet laureate, mainly as a reward for his loyalty to Pitt; for though he had a sincere love of letters, his poetry was dull and pedestrian. The appointment provoked general ridicule, but Pye retained it with complacency until his death, Aug. 13, 1813.

Pye Corner OR **PIE CORNER.** London landmark, at the N. end of Giltspur Street, E.C. The name is said to have been derived from an inn. A small gilt figure of a fat boy on the corner house of Cock Lane perpetuated the legend that the Great Fire of 1666, starting at Pudding Lane and finishing at Pye Corner, was due to gluttony. In fact, while it was stopped at Cock Lane, it continued to rage about Cripple-gate 20 hours after Pye Corner had been razed. See Great Fire.

Pyelitis (Gr. *pyelos*, pelvis). Inflammation of the pelvis, or inner part, of the kidney; most often due to a stone in the kidney, which may need surgical removal, or to extension of inflammation from the bladder or neighbouring organs. The symptoms are pain in the back, irritability of the bladder, blood or pus in the urine, and intermittent fever. The urine should be rendered either acid or alkali according to the nature of the infecting germ. Penicillin and the sulpha drugs help treatment.

Pyeshkov, ALEXEI MAXIMOVITCH (b. 1869). Russian author, best known by his pen-name of Maxim Gorky (*q.v.*).

Pygmalion. In Greek mythology, king of Cyprus, who made a statue in ivory of a beautiful maiden. He was so charmed with his creation that he fell in love with the statue and prayed to the goddess Aphrodite to give it life. His request was granted and he married the maiden and had by her a son called Paphus. See Galatea.

Pygmalion. Play by Bernard Shaw. It was produced April 11 1914, at His Majesty's Theatre, London, where it had a run of 118 continuous performances. The story deals with the transformation of a Cockney flower-girl, Eliza Doolittle, into the semblance of a duchess, almost entirely by altering her enunciation under the tuition of a professor of phonetics,

Henry Higgins. In the original production Higgins was played by Tree, Eliza by Mrs. Patrick Campbell. In a film version, 1939, the parts were played by Leslie Howard and Wendy Hiller. The play gained notoriety for its introduction, then almost unprecedented on the London stage, of the vulgar expletive "bloody."

Pygmy. Name applied to diminutive peoples. Derived from the Gr. *pygmē*, the measurement of the

forearm and the closed fist, the term was used by Homer and Herodotus for fabled races in Ethiopia and India. It now denotes the dwarf tribes encountered by Schweinfurth, du Chaillu, Stanley, and others in equatorial Africa, and the negritos of S.E. Asia. See Dwarf Races; Giant; Negrito.

Pyjamas. Form of nightwear consisting of a loose jacket and trousers. The word is Anglicised from the Persian *pa'ejama*, lit. leg clothing, trousers, fastened by a cord or cummerbund. The wearing of pyjamas by both sexes has increased greatly during the 20th century, the form having almost entirely superseded the male nightshirt; children's pyjamas are sometimes a single combination garment, and in some the cord is replaced by elastic. In another form they gained popularity as feminine beach-wear.

Pyldes. In Greek mythology, the devoted friend of Orestes, who gave him his sister Electra in marriage. The friendship of Orestes and Pyldes is proverbial.

Pylon (Gr., gateway). Massive temple-portal in ancient Egypt. Developed at Thebes in the XVIIIth dynasty, it usually comprised a monolithic lintel, corniced on lofty jambs, and flanked by two truncated pyramidal towers, with sculptured hieroglyphs. Vertical grooves held poles for coloured streamers on feast-days. The approach was between royal statues, often colossal, and a pair of obelisks. A notable example, Edfu, is 250 ft. wide, and 115 ft. high. At

Karnak (*q.v.*), five successive pylons were added to the Great Temple of Senusert I in subsequent reigns. See Architecture illus., p. 569; Egypt illus., p. 2962.

Pylon. Tapering lattice tower built of steel to carry heavy power cables. In aeronautics it is the structure over the fuselage of a helicopter which supports the rotor arms. The name is also given to structures marking the course for aircraft racing in closed circuits. The "pylon school" of poetry was a phrase coined to describe the work of writers who believed that industrial machinery

Pygmy. A pygmy of the Belgian Congo, and, left, inhabitants of the Andaman Islands

was a suitable subject for poetry; the actual poem, Pylons, being by Stanley Snaith.

Pylorus (Gr. *pylē*, gate; *ouros*, warder). Distal or intestinal aperture of the stomach. It is surrounded by a ring of muscular fibre which, following a meal, is in a state of contraction, thus retaining the food in the stomach for the process of digestion. At varying intervals the muscular fibres relax, and food is allowed to pass into the intestine for further digestion.

Pylos. Town in S.W. Messenia, ancient Greece, about 60 m. W. of Sparta. In legendary times the venerable Nestor, of the Homeric poem, was its king. In 425 B.C. it was seized by the Athenians in the Peloponnesian War; and in the adjacent Bay of Navarino the Turkish fleet was defeated by the allied fleets of the British, French, and Russians in 1827, a victory which secured the independence of Greece. The modern Pylos or

Navarino (*q.v.*) stands at the S. end of the bay.

Pym, JOHN (1584-1643). English statesman. He was born at Brymore, Somerset, and educated at Pembroke College (then Broadgates Hall), Oxford, afterwards becoming a student at the Inner Temple, though he was never called to the bar.

John Pym, English statesman

In 1614 he became M.P. for Calne, and in 1625 for Tavistock. Already a prominent member of the parliamentary party that was coming into conflict with the crown, he was one of the managers of the impeachment of Buckingham in 1626, one of the chief supporters of the Petition of Right in 1628, and in 1629 an energetic opponent of the tonnage and poundage proposals. Between 1630 and 1640 he was engaged in schemes for the settlement of Connecticut.

Pym was in effect the leader of the Short Parliament of 1640, moved the impeachment of Laud, took a principal part in that of his former friend Strafford, and had a share in the Grand Remonstrance of 1641, when he first put forward the proposal to check the royal power by making ministers responsible to parliament. He was one of the five members whose attempted arrest by the king in 1642 precipitated the Civil War. By now the inseparable ally of Hampden, he controlled the party headquarters when the struggle broke out; secured an alliance with the Scots, himself becoming a Presbyterian; and was made master of the ordinance a month before he died on Dec. 8, 1643. Pym was allowed by all to have been a great parliamentarian, but royalists necessarily regard his dealings with the Scots against King Charles as questionable. A Life by S. R. Brett was published in 1943.

Pyorrhoea. Disease (*Pyorrhoea alveolaris*) of the tissue surrounding the necks of the teeth. It arises in the gums and possibly in alveolar processes, i.e. those connected with the sockets of the teeth. Its characteristic symptom is the exudation of matter from the gums around the necks of the teeth. Associated with this is inflammation of the gums; they recede, alveolar bone is lost, and the teeth become loose. Rings of tartar collect under the edges of

Pyramids. Diagram indicating the arrangement of the chambers, passages, and air channels in the Great Pyramid

the gums, giving rise to halitosis. The causes of pyorrhoea are lack of cleanliness, breathing through the mouth, and certain illnesses, especially fevers. Deposition of tartar follows the lack of cleansing. Artificial methods which help to prevent pyorrhoea include massaging the gums with fingers night and morning, and using a mild antiseptic mouth-wash.

Pyramid. In geometry, a polyhedron, one of whose faces, the base, is a figure of three or more sides, i.e. polygon, and the others triangles. The latter meet at a point, the vertex of the pyramid. When the base is a regular polygon and the vertex is on the perpendicular to the base from its centre point, the pyramid is called a regular pyramid.

Pyramids. Monumental structures on a polygonal base, usually square, with triangular sides, generally in one plane, sloping to an apex. The word is the grecoised form of an Egyptian term. Conjectured at various times to be

astronomical observatories, standards of measurement, treasure-houses, and even Joseph's granaries, these monuments, originated in early dynastic Egypt, are simply gigantic tombs, each pyramid designed for a single interment.

About 75 examples remain in the necropolis field of Memphis, on the left bank of the Nile between Abu Roash and Dahshur. They stand on the desert edge just beyond the cultivated alluvium, above high-Nile. The design emerged from the mastaba-tomb, and a transitional form occurs in the step-pyramid at Sakkara, erected by Tchoser of the IIIrd dynasty. This comprised a limestone mastaba, periodically enlarged until it became a quadrangular turret in seven diminishing stages.

At the end of the IIIrd dynasty Seneferu, when erecting at Medium a similar structure, formulated the pyramid type by adding casing blocks to impart continuous slope to the sides, and removing the funerary chapel to the outside.

The present step-like appearance of this pyramid results from the demolition of the casing. The original height was proportioned to the circuit of the base as the radius of a circle to its circumference, the dimensions being 7 and 44 times a unit of 25 cubits. This made the angle of slope in the finished pyramids 50° to 55° , whereas in its present uncased form Medium has reverted to 75° , the normal angle of slope of mastaba-tombs.

Seneferu's successor Khufu (Cheops) produced the great pyramid of Gizeh, the only one of the "seven wonders of the world" still extant, and the most stupendous work of human hands. The proportions repeated those of Medium, the unit being lengthened to 40 cubits. This gave a height of 481 ft., a base line of 775 ft., and a volume of 88,500,000 cub. ft. of masonry, weighing 6,840,000 tons. It comprised 2,300,000 blocks averaging $2\frac{1}{2}$ tons apiece, piled in 210 horizontal courses upon $12\frac{1}{2}$ acres. The disappearance of the casing blocks enables modern tourists to clamber over the 3 ft. courses to the truncated summit. The entrance, 48 ft. up the N. face, was sealed by a block protecting a system of passages to three main chambers. From the entrance a passage descends to an unfinished chamber $101\frac{1}{2}$ ft. below the plateau level. This was abandoned, and an ascending passage formed at 60 ft. from the entrance. Thence a horizontal gallery diverged to the so-called queen's chamber, perhaps utilised for the statue of the king. The upward ascent, enlarged into a grand gallery, leads to the king's chamber, containing a granite sarcophagus, now lidless. This chamber was lined and roofed with massive granite blocks, floated downstream from Assuan.

Herodotus and Diodorus described the reputed methods pursued by the pyramid-builders. Khufu was computed to have employed 100,000 men during the

Pyramids. Sectional views of the Second and Third Pyramids of Gizeh, showing the extent of the excavations and the portion removed in the attempt to reach the sepulchral chamber of the Third Pyramid

1. Great Pyramid, of Cheops, and the Sphinx, from the S.E. 2. Entrance to the Great Pyramid, 48 ft. from the ground on the N. side. 3. Second pyramid, of Khafra, showing the remaining incrustation of limestone slabs

on the upper courses. 4. N.E. corner of the Great Pyramid, where the ascent is usually made. 5. Third pyramid, of Menkaura. 6. Main passage which leads to the sepulchral chamber of Cheops, in the Great Pyramid

PYRAMIDS: SEPULCHRAL MONUMENTS OF THE ANCIENT EGYPTIAN KINGS

Pyramids of Gizeh, from the south. Behind the three small pyramids stands the Third Pyramid, on its right the Second, and beyond that the Great Pyramid

three months of the inundation for 20 years. Traces remain of the quarry road over which the limestone blocks were hauled from Tura, 9 m. away, and then poised in position over temporary earthen ramps. The stonecutters and masons, doubtless employed all the year round, used saws up to 9 ft. long, and for hollowing out the sarcophagi tubular drills, all with fixed cutting points.

The second Gizeh pyramid, erected by Khafra, was 454 ft. high, with a base of 708 ft., and two tomb-chambers on or below ground level. The third, Menkaura's, was 219 ft. high, with a base of 356½ ft. Menkaura also set up a brick pyramid at Dahshur. At Abusir and Sakkara stand the pyramids of Vth and VIth dynasty kings. Those of Unas and his immediate successors at Sakkara bear upon their chamber walls hieroglyphic inscriptions, the so-called "pyramid texts" which were embodied in the Theban Book of the Dead. These Old Kingdom sepulchres were imitated during the XIIth dynasty, mostly with cores of air-dried brick, at Lisht, Dahshur, Illahun, and Hawara, near or within the Fayum.

Much controversy has arisen over the manner of planning the dimensions of these monuments. Lepsius argued that each king began his reign with a nucleus plan, regularly enlarged as the reign lengthened. Petrie regards such a method as disproved by the position of the galleries. A view

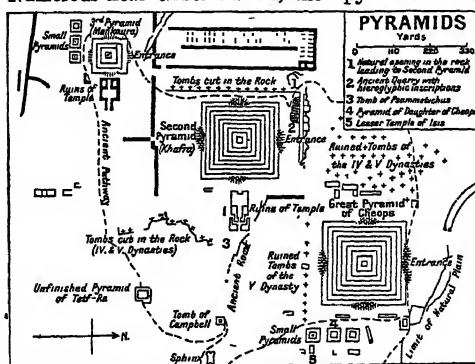

much favoured is that most pyramids were planned in a moderate size, and never altered, but that the multiple chambers in the three largest examples point to plan-revision, once or twice only, during the reigns of their builders.

Pyramidal tombs, about 30 ft. high, were erected over the remains of nobles and high officials. Pyramids form part of some XIth dynasty structures at Thebes, but never as independent sepulchres. Monolithic memorials of New Empire priests and judges assumed the form of miniature pyramids, with scenic reliefs. During the New Empire the pyramidal form was simulated in Nubia by chambered sepulchres above ground, usually with porticoes, steep-pitched sides, and flattened tops. Numerous near Gebel Barkal, the

ancient Napata, they nowhere exceed 60 ft. in height. At Meroë there are about 200, including those of Candacë queens down to the 2nd century A.D.

The Egyptian pyramid-tomb was never naturalized by the nations around. The geometrical form influenced Phoenician architecture, and became fashionable in Augustan Rome, as in the marble-faced concrete pyramid of Cestius, 116 ft. high, within the Aurelian wall. Earthen tumuli and stone cairns, raised in many parts of the world, with roundish outlines, are related only remotely to the Egyptian form of four plane faces sloping to an apex. This quadrangular shape marks some pyramidal mounds of early Chinese emperors. Prehistoric truncated pyramids also occur in Tonga,

Tahiti, and other Pacific islands, and became characteristic of the advanced Maya and Toltec architecture of pre-Columbian America. See Dongola; Egypt; Mastaba; Teocalli; consult Pyramids and Temples of Gizeh, W. M. F. Petrie, 1883; The Nile, E. A. Budge, 10th ed. 1907; The Pyramids of Egypt, I. E. S. Edwards, 1947.

Pyramids. Plan showing the relative positions of the Pyramids of Gizeh and the adjacent ruins

Pyramids. Reconstruction of the Pyramids of Abusir as they were built by the kings of the Vth dynasty, c. 3500 B.C. Based upon the beautiful reconstruction by Herr Borghardt, the German Egyptologist, in his "Grabdenkmal des Königs Ne-user-ra"

Pyramids. Game played on a billiard-table. Fifteen coloured balls are arranged in the form of a compact pyramid, or triangle, the ball forming the apex of the triangle resting on a spot, called the pyramid spot, midway between the centre spot and the billiard spot on the table, and the base of the triangle towards the top cushion. The game is usually played by two persons, although sides of any convenient number can be formed, who use a sixteenth white ball alternately. The game consists entirely of winning hazards, the object being to pocket more of the coloured balls than one's opponent.

The order of play having been determined, A plays from the D at the coloured balls. If he pockets one or more he continues his innings, playing from where the white ball stops until failure occurs, when it is B's turn to proceed. Should a player pocket the white ball one point is deducted from his score, and a coloured ball previously pocketed is placed on the pyramid spot, or, if that is occupied, as near to it in a straight line from the top cushion as possible. If the striker who runs in, i.e. pockets or loses the white, has not previously scored a red ball, he is said to owe one, and the next ball he takes is replaced on the table, the stroke not counting to him, except that his penalty is nullified. When all the coloured balls but one have been pocketed, the white is used by the first striker as the cue ball,

and the coloured one by his opponent. Should either player then run in a pocket, or give a miss, it counts to his opponent, and the game is over.

As played by leading professionals it gave great scope for skill. Their method, usually, was to pay very little attention to scoring during the early stages of the game, but to manoeuvre until an opportunity presented itself of taking several balls in an innings. In this connexion it is recorded that in a private match the late William Cook and the (then) younger Roberts played for two hours, at the end of which period both were owing three balls. There was once a professional pyramid championship. The last time it was contested was at the Guildhall Tavern, London, in March, 1875, when the late W. Cook defeated D. Richards. See Billiards; Snooker.

Pyramids, BATTLE OF THE. Battle fought near Embabeh, Egypt, in which Napoleon Bonaparte defeated the Mamelukes under Murad Bey, July 21, 1798. The Egyptian forces, totalling about 37,000, were drawn up between the Nile and the Pyramids of Gizeh, with a smaller force of 1,000 Mamelukes under Ibrahim on the further river-bank. Soon after dawn Bonaparte's five divisions, in square formation, advanced. In spite of a furious Mameluke charge against Desaix's division, the French routed their enemy, captured Embabeh, and

drove its defenders into the river. Many escaped by swimming, but over 1,000 were drowned and 600 killed. The French losses were light, and two days later Bonaparte entered Cairo. Before this battle Bonaparte, addressing his troops, is believed to have used the famous phrase, "Soldiers, remember that from these Pyramids forty centuries look down upon you!" See Egypt: History.

Pyramus. In Babylonian legend, a youth who loved a maiden named Thisbe, and, their parents refusing consent, used to talk with her through a chink in a wall. Having resolved to marry, the pair agreed to meet under a mulberry bush by the tomb of Ninus, and flee together. Thisbe reached the rendezvous first, but was frightened away by a lion. Pyramus then arrived, and finding a veil which Thisbe had dropped, stained by contact with the lion's gory jaws, concluded that she had fallen a victim to the brute, and killed himself with his own hand. Thisbe, returning to find Pyramus dead, killed herself also. In memory of the tragedy the fruit of the mulberry was red ever afterwards. The story is told by Ovid in his *Metamorphoses*, and is made use of by Shakespeare in *A Midsummer Night's Dream*.

Pyargyrite (Gr. *pyr*, fire; *argyros*, silver). Sulphide of silver and antimony ($3 \text{ Ag}_2\text{S} \cdot \text{Sb}_2\text{S}_3$), containing 60 p.c. silver. Dark red to black, it is a valuable silver ore.

Pyrazole. Organic chemical with a carbon-nitrogen ring structure formed by the action of hydrazine on epichlorhydrin in the presence of zinc chloride. No member of the pyrazole series is known to be formed in nature. Pyrazole is a weak base of great stability. Its most important derivative is antipyrine, a febrifuge extensively used in medicine.

Pyrenees (Fr. *Pyénées*; Sp. *Pirineos*). Mountain range of S.W. Europe, dividing France from

peaks are found in the central section. Next to the Maladetta or Pic de Néthou (*q.v.*), the loftiest crests are the Pic des Possets (11,047 ft.), Monte Perdido (10,997 ft.), Vignemale (10,794 ft.), Marboré (10,673 ft.), Pic du Midi (9,466 ft.), and Canigou (9,137 ft.). Apart from the highroads and rlys. from Bayonne to San Sebastian, and from Perpignan to Figueras, there are only two carriageways across the Pyrenees, though there are some fifty footways. The oldest

pass, on the Roman road from Saragossa to Oloron, is the Col de Somport, via Jaca and Canfranc; the other, the Col de la Perche, leads from Villafranche to the Segre valley. One of the most frequented is that from St. Jean de Pied de Fort to Pampeluna. The pass from Perpignan to Figueras was traversed by

France and Spain. The treaty of Westphalia had put an end to the European war except as regards hostilities between these two countries, and in 1659 Mazarin met the Spanish minister on the Isle of Pheasants in the Bidassoa, just beneath the Pyrenees.

The treaty signed there provided for mutual restorations of territory, and the Pyrenees became the boundary between the two countries. See France; History.

Pyrenées-Orientales. Southern dept. of France. Its area is 1,598 sq. m. Bounded S. by Spain and E. by the Mediterranean, its chief rivers are the Ariège, Aude, Tet, Tech, and Agly, and it includes Mont Canigou (9,137 ft.), the most easterly peak of the Pyrenees. There are several lakes, the most important being the Étang de Leucate. Iron, copper, lead, and granite are mined, choice fruits are grown, and the vines yield red and muscatel wine. Perpignan is the capital. Until the Revolution the dept. was partly in Roussillon and partly in Languedoc. Pop. 228,776.

Pyrethrum OR FEVERFEW. Name for several species of *Chrysanthemum*, esp. the gold feather (*C. aureum*). A native of the Caucasus, it was introduced to Great Britain in 1804. It is a perennial herb, about 2 ft. high, with aromatic yellow leaves cut into incised lobes, and daisy-like white flowers with yellow centres. It is largely used for carpet bedding and edgings, and is therefore grown as an annual to obtain small plants, which are frequently nipped to keep them dwarf. Some species are used in insecticides (*q.v.*), Kenya being the principal source.

Pyrgos. Town of Greece, capital of the dept. of Elis. Situated on the N. of the Gulf of Arcadia, W. Morea, it is about 50 m. S.S.W. of Patras, with which it is connected by rly. The local products, currants, grapes, and oranges, are exported through Katakolon by rly. 12 m. E. are the ruins of Olympia. Pop. 19,336.

Pyridine. Colourless liquid with a characteristic pungent odour extracted in quantity from coal tar. It is also present in considerable quantities in bone oil. Pyridine is used as a denaturant for alcohol (see Methylated Spirits), as a solvent in the rubber, paint, and varnish industries, and to some extent as a remedy for asthma. It is present in tobacco smoke.

Pyrite, OR IRON PYRITES. Widely distributed form of iron sulphide (FeS₂). Occurring as brassy-yellow

Pyrenees. The Cirque de Gavarnie, one of the cirques which are a peculiar feature of the Pyrenees, each with its hollow, or amphitheatre, carved out by glacier erosion

Spain. Extending from Cabo de Créus on the Mediterranean to Fuenterrabia on the Bay of Biscay, its length is 270 m. and breadth between 25 m. and 90 m. The W. continuation of the mt. system which runs almost due W. along the Biscayan borders of Spain is known as the Cantabrian Mts.

The highest point of the Pyrenees proper reaches an alt. of 11,168 ft. in Mt. Aneto or Pic de Néthou. The mean height is only 3,930 ft. for the whole range; the highest peaks are not on the axis, but rise from great transverse ridges, which, with the numerous valleys running at right angles to the chain, constitute one of its chief features. The line of perpetual snow is high, ranging from 8,800 ft. on the N. side to 9,200 ft. on the S. Another peculiarity is the great, deep, water-worn gullies, called cirques (Sp. *ollas*, pots), such as the cirque of Gavarnie (*q.v.*). Towards the Atlantic the average alt. decreases, and by the shores both of the Bay of Biscay and of the Mediterranean a low, fairly level tract admits of easy passage between France and the peninsula.

The Pyrenean chain is sometimes divided into three sections: the Central Pyrenees between the Pic des Escaliers and the Col de la Perche, and the Western and Eastern Pyrenees, lying either side of these points. Most of the highest

Hannibal in 218 B.C. An international rly. line runs through the tunnel of Canfranc.

In this mainly granite formation there are signs of volcanic upheaval, and there are strata of Silurian deposits and Cretaceous limestones of the Eocene period. Copper, silver, lead, coal, lignite, and iron are found. The mines of the Pyrenees were known to the Carthaginians and Romans, and several are still worked. Thermal and mineral springs abound. Noted resorts close to or on the mountains are Gavarnie, Pau, Cauterets, Tarbes, Lourdes, Bagnères-de-Bigorre, Luz, and Bagnères-de-Luchon. Of rivers with their source in the Pyrenees, the chief are the Aude, Garonne, and Adour on the N., and the Aragon, Segre, Llobregat, and Noguera on the S. There are many forests of fir, pine, box, and, on the lower slopes, evergreen oaks. Plants grow up to a line some 500 ft. higher than in the Alps. Wild animals include the bear, lynx, wild cat, chamois, wolf, boar, deer, and ibex. Generally speaking, the Franco-Spanish frontier coincides with the line of the highest peaks. The tiny republic of Andorra (*q.v.*) lies within the range. Consult The Pyrenees, H. Belloc, 3rd ed., 1923; Pyrenean Festivals, V. Alford, 1937.

Pyrenees, PEACE OF THE. Treaty signed in Nov., 1659, between

low cubes, grains, or masses, it often contains small quantities of nickel, cobalt, copper, and gold. Pyrite is occasionally a constituent of igneous, sedimentary, and metamorphic rocks. It is common in mineral veins and may be present in such abundance that it is mined for copper or gold. Its sulphur content is used in the form of sulphur dioxide, sulphuric acid, or as sulphate in the preparation of wood pulp, fertilisers, preservatives, etc. See Chalcocopyrite.

Pyroclastic Rocks. Group of rocks formed by the consolidation of volcanic ashes, bombs, and ejected blocks. They are commonly associated with lavas, or may occur interbedded with normal sediments after they have been blown by the wind far from their source of origin. They vary in degree of fragmentation from chaotic assemblages of great blocks to fine dust. The very coarse are referred to as agglomerate or volcanic breccia; finer varieties are called tuffs or ashes. See Volcano.

Pyrogallol. Tri-hydroxy-benzene ($C_6H_3(OH)_3$), usually known as pyro, once the most popular photographic developing agent but now less commonly used. Its rapid oxidation properties and ability to produce a deeply stained image are sometimes advantageous where there is known to be under-exposure. Its properties were discovered by Maddox in 1871.

Pyroligneous Acid. Name given to crude acetic acid (*g.v.*), obtained by the destructive distillation of wood. Pyroligneous acid is sometimes sold as essence of smoke, and is used for imparting to hams and bacon a smoky flavour.

Pyrolusite (Gr. *pyr*, fire; *lousin*, to wash). In mineralogy, the name given to manganese dioxide. Nearly black to steel-grey in colour, with a metallic lustre, it is one of the common ores of manganese. It is used as a colouring material, and in the manufacture of chlorine and oxygen and manganese alloys. See Manganese.

Pyromancy (Gr. *pyr*, fire; *manteia*, divination). Divination by fire, practised in classical times and probably much earlier. The movements of the flame and the forms assumed by the embers were noted, and omens deduced from them. See Divination; Magic.

Pyrometer. Instrument for measuring temperature. The simplest form is a mercury thermometer, though, usually, the term is used only to describe instruments for measuring higher or lower temps. than those measurable with

a thermometer. Some pyrometers are operated by expanding metal or gas, others electrically, some optically, and some by the melting of various materials.

Fig. 1.

Fig. 2.

Fig. 3.

Fig. 4.

Fig. 5. Pyrometer. Diagrams illustrating various types of the instrument. See text.

Expanding metal pyrometers are sometimes used when a high standard of accuracy is not required, and the maximum temp. is not above $1,200^{\circ}\text{C}$. There are two types: (a) those in which two separate bars of dissimilar metals are heated side by side and the difference in thermal expansion between them is amplified to an indicator through a gear train; and (b) those in which a bimetallic strip or coil is heated and unequal expansion of the two metals causes bending of the strip, or a change in length of the coil; the change, amplified through a gear train, is recorded on an indicator.

Volumetric change in a gas is used, occasionally, to measure a change in temp. The arrangement is shown in Fig. 1, in which A is the gas bulb exposed to the varying temp. Any change in temp. results in a change in volume of the gas which is shown by a change in the levels of the liquid contained in the U-tube, one branch of which is connected to the bulb, and indicated by a graduated scale, against which the remaining arm is held, as shown.

The commonest electrical pyrometer has a thermocouple, the operation of which is based on two facts: (a) if two dissimilar metals are in electrical contact, then there will be a potential difference between them, which will vary with

the temp., and (b) if a length of metal wire is hot at one end and cold at the other, there will be a potential difference, between the ends, which will vary with temp.

Two equal lengths of wire are taken, each made from a different metal, one of which tends to increase and the other to decrease in potential as the temp. rises (e.g. chromel and alumel respectively). One pair of ends, to be exposed to the temp. which it is desired to measure, is welded together and called the "hot junction".

The separate ends are maintained at a constant standard temp. and are connected to the terminals of a galvanometer or millivoltmeter. The potential differences will be cumulative and indicated

on the recording instrument. Any change in temp. at the couple end will produce a change in potential, from which the actual temp. can be estimated. The arrangement is shown diagrammatically in Fig. 2. The thermocouple wires A are mounted in a protective sheath B, with the couple exposed and the remaining lengths of wire carefully insulated from each other. The cold junction ends are carried into C, an ice-box or other temp. compensating device, before connexion to D, the galvanometer or millivoltmeter. This type of pyrometer, which measure temps. up to $1,600^{\circ}\text{C}$., is used specially for measuring low temps. e.g. that of the stars in astronomical observation.

A very simple electrical pyrometer is illustrated in Fig. 3. This measures the change in electrical resistance of a metal wire as it varies with the temp. A is a double coil of platinum wire, on a heat resisting former B, enclosed in a protective sheath C. D is a resistance measuring bridge which can be mounted at any convenient distance away from the resistance wire, so the leads are shown broken at x and y.

The optical-electric pyrometer is shown in Fig. 4. A, shown as a thermophile, could be a thermocouple or a photo-electric cell, on which beams of radiant heat a, b, c, d, e, f, are focused by the opti-

cal system B. The optical system is adjusted by the screw D. Changes in potential are indicated by C, the galvanometer or millivoltmeter.

Optical pyrometers are used to measure temps. of more than 750° C. and depend on the changes in colour and brilliancy which take place on a body as its temp. changes. From the changes, measured accurately by a photometer, the temp. is estimated. One scheme is shown in Fig. 5, in which *a*, *b*, are rays from the heat source. These are passed through adjustable filters D and viewed, through optical system B, side by side with a standard light from a source A reflected in mirror C, which can be adjusted at E. In operation the filters are altered until the radiations look of the same intensity and colour as the standard, upon which the temp. can be read from a graduated scale on the filters.

In the hot wire, or disappearing filament, pyrometer the radiations are viewed through an optical system which includes a filter, to prevent dazzle, and an electrically heated filament interposed in the path of the rays. The electric current is varied until the filament is invisible against the background of the radiations. The magnitude of the current gives a measure of the temperature of the source of the radiations.

J. G. Tweeddale, A.M.I.Mech.E.

Pyrope. Blood-red variety of garnet; chemically a magnesium aluminium silicate. Alternatively named precious garnet, it is found in basic igneous rocks of the serpentine and peridotite groups; also in detrital deposits, as in Ceylon. When transparent, pyrope is cut as a gemstone, and though it is usually of small size, large specimens have been found. Those obtained in the diamond fields of S. Africa are known as Cape rubies, but are easily distinguished from genuine rubies by their optical properties.

Pyrophorus. Substance which takes fire on exposure to air. Homberg (1662-1715) discovered that if he heated together in a tube a mixture of lamp black, alum, and flour, the charred mass caught fire on being shaken out of the tube. In the same way sulphides of potassium, sodium, and lithium can be prepared, which take fire on exposure to air. Pyrophoric iron and lead are also known, the latter being made by charring lead tartrate. The pyrophoric iron used in pocket lighters is an alloy of iron and cerium. When struck or rubbed this alloy gives off brilliant

sparks, which in pocket lighters are made to ignite petrol vapour.

Pyroxene. In mineralogy, the name given to a group of silicates which are important rock-forming minerals. They are generally silicates of calcium and magnesium, but may also contain iron, aluminium, chromium, manganese, zinc, etc. The chief pyroxenes are augite, an aluminium pyroxene; diopside, a calcium manganese, white, grey, yellow, or green in colour; hedenbergite, a calcium-iron pyroxene, black in colour. The pyroxenes are constituents of limestone gneisses and igneous rocks, particularly the latter, and some are cut and polished as gemstones. See Augite; Diopside.

Pyroxylin. Alternative name for nitrocellulose (*q.v.*), and particularly for the soluble variety used for the preparation of collodion, in pharmacy, for making lacquers and photographic film, and in applications outside explosives.

Pyrrho (d. c. 275 B.C.). Greek philosopher, founder of the first school of Sceptics. He was a native of Elis, and accompanied Alexander on his Indian campaigns. His chief doctrines were: We can know nothing of the real nature of things, since the contrary of everything that appears true may be equally true; we must therefore withhold our judgement and, whatever happens, preserve our imperturbability of mind, which alone brings happiness. Virtue is the only thing that really matters; all external things are indifferent.

Pyrrhotite. In mineralogy, iron sulphide with excess sulphur. Often it contains nickel, sometimes up to 5 p.c., and constitutes the most valuable ore of nickel. Generally it is found as reddish-brown to coppery metallic masses in veins and magmatic segregations. The most important deposit is that at Sudbury, Ont., the world's largest nickel producer.

Pyrrhus (318-272 B.C.). King of Epirus, and one of the most noted generals of ancient times. His father Aeacides having been deposed, Pyrrhus lived for some years under the protection of an Illyrian chief named Glaucias.

When 12 he was restored to the throne of his father, but in five years' time, owing to the intrigues of Cassander (*q.v.*), he was again in exile. Taking service under Antigonus, he found himself a hostage of the Egyptian king Ptolemy, when his patron had been defeated at the battle of Ipsus, 301 B.C. Ptolemy assisted Pyrrhus to recover his father's

throne and gave him his daughter in marriage. Consolidating his position as king of Epirus, Pyrrhus endeavoured to extend his dominions, chiefly at the expense of Macedonia, and for a time was in actual possession of the whole of that country; but in 286 was beaten at Edessa and driven out.

In 281 B.C. the inhabitants of Tarentum in southern Italy, who were then at war with Rome, appealed to Pyrrhus for help, and he appeared in Italy with a considerable army. The Romans were defeated in battles at Heraclea, 280, and Asculum, 279, but at such cost in life that the term "Pyrrhic victory" has passed into a byword. An invitation from the Sicilian Greeks for assistance against the Carthaginians took Pyrrhus over to Sicily in 278, his lieutenant Milo being left in command at Tarentum.

The Sicilian campaign was at first successful, but finding himself handicapped by the lack of unanimity among the Sicilian cities, Pyrrhus in 276 returned to Tarentum. His last battle with the Romans took place at Beneventum in 275, and resulted in a severe defeat. His resources failing, he returned to Epirus, but before long was again engaged in schemes of conquest. After failing to take Sparta, he attacked Argos, but in the street fighting in that city he was killed by a tile thrown from one of the houses by an old woman. A romantic figure, he was mainly an adventurer, but merits applause for his clemency and for the splendid discipline of his troops.

Pyrrhus, or Neoptolemus, was also the name of a legendary character: the son of Achilles, and the slayer of King Priam when the Greeks took Troy.

Pyrus. Genus of trees of the family Rosaceae. See Apple.

Pyruvic Acid. Organic liquid acid, with an odour resembling meat extract and acetic acid. It is also called pyroracemic acid, because it is produced by the distillation of racemic acid, an isomer of tartaric acid. Lactic acid is formed by the action of nascent hydrogen on pyruvic acid.

Pytchley. Famous English hunt. It hunts a stretch of country in Leicestershire and Northants, from Market Harborough to Northampton, the district being about 20 m. from N. to S., and 25 from E. to W. The kennels are at Brixworth. Founded about 1750, it had Earl Spencer as first master, and later squire have been among its leading supporters. In 1827-34

Squire Osbaldeston was master. The Woodland Pytchley is an offshoot of the Pytchley, having been established in 1874 for sport in country N. and E. of that now hunted by the older pack. The kennels are at Brigstock. Both packs are the property of the members. Consult *The Pytchley Hunt*, Nethercote, 1888. *Pron.* Pie-chly.

Pythagoras (b. c. 582 B.C.). Greek philosopher. Born at Samos, he settled at Crotona, in Italy,

Pythagoras,
Greek philosopher

about 529 B.C., having probably made journeys in Egypt. He founded a school or society, half-religious, half-philosophical. His disciples were bound by the strictest rules, underwent a comprehensive training in gymnastics, mathematics, and music, practised vegetarianism, and believed in immortality and the transmigration of souls. The mystic side of his philosophy seems to have been derived by Pythagoras from the hymns attributed to the mythical Orpheus, and also perhaps from his travels in Egypt.

Like the philosophers of the Ionian School, Pythagoras attempted a scientific explanation of the universe in terms of some one thing, but whereas Thales taught that all substances are variants of water, and Heraclitus that they were variants of fire, Pythagoras found the *arché*, or first principle, of the universe in number—which, he taught, determined the harmonies of music, the proportions of architecture, the movements of the sun, moon, and stars, and the harmonies of the spheres.

From these foundations it was easy to identify number with everything that is orderly, proper, right, good, and beautiful. Pythagoras is regarded as the real founder of the science of geometry, and also as the discoverer of the musical octave. The proof of the famous 47th proposition of Euclid (namely, that in a right-angled triangle the square of the hypotenuse is equal to the sum of the squares of the other two sides) is attributed to him. The body of doctrine he taught was carefully conserved by his followers and had great influence upon speculative thought. The philosophy of Plato is much indebted to Pythagoras.

Pytheas (4th century B.C.). Greek geographer and astronomer.

A native of Massilia (Marseilles), he navigated the coastal waters of Europe from Gades (Cadiz) as far as Thulé, probably the Orkneys and Shetlands, and published the result of his expedition in works only fragments of which remain. Pytheas calculated the height of the sun by observing in his native place the relation of the gnomon to the length of its shadow at the time of the summer solstice, and is said to have been the first to connect the spring tides with the phases of the moon.

Pythia. Priestess of Apollo, who gave the responses at the oracle of Delphi or Pytho.

Python. In Greek mythology, the serpent born of the mud left by the flood which overwhelmed the world in the time of Deucalion (q.v.). This serpent was killed on Mt. Parnassus by Apollo with his bow and arrows, and the Pythian Games were supposed to celebrate this victory. See *Leto*.

Python. Genus of large serpents found in the tropical parts of the E. hemisphere. They belong to the boa family, and are distinguished by the structure of the skull. None of them has poison fangs, but the jaws carry numerous sharp curved teeth. The backward curve of the teeth makes it impossible for the victim to tear himself away.

But the conspicuous characteristic of the pythons is their great size. Usually they range from

Python. 1. Portion of Indian python showing, at A, spur or vestige of pelvic girdle. 2. Lower and, above, upper jaw of Indian python. 3. Coiled specimen
W. S. Berridge, F.Z.S.

15 to 20 ft. in length, and have been known to attain 30 ft., with a thickness of body in proportion. They kill their prey by constriction with the coils of the body, by which means the bones of the victim are broken and the entire body crushed and elongated for swallowing. Pythons live among trees near water, and capture their prey—small deer, goats, and other animals—by night. The female has the unusual habit of incubating her eggs, lying coiled about them for some eight weeks.

There are numerous species, all handsomely marked and mottled. See *Animal*, colour plate; *Snake*.

Pyx (Gr. *pyxis*, box). Vessel in which the Blessed Sacrament is reserved for administration to the sick. The word is found in a decree of Pope Leo IV (c. 850), ordering that nothing shall be placed above the altar save the pyx, and in early times the pyx

was kept suspended above the altar. Later it was kept in the locked tabernacle on the altar. The pyx is usually of vase form.

Pyx, TRIAL OF THE. Periodical testing of gold and silver coins issued by the English mint. The practice

dates from the time of Henry II, and undoubtedly originated in the testing of coins made for the king by private contractors. The coins are now tested annually, as a rule by persons selected from the Goldsmiths' Company, the practice being that (formerly) one gold coin out of every 2,000 minted and one silver coin out of every 60 lb. troy of silver was put aside in the pyx or box for the purpose. The trial takes place in the hall of the Goldsmiths' Company, London. See *Mint*.

THE letter Q has altered very little in its shape since its forerunner in the Semitic alphabet of 1100 B.C.  or , known as *qoph*. There is considerable divergence of opinion as to the meaning of this word. It is variously said to denote eye, ear, needle, opening, knot, and ape. It was pronounced with a *k* sound, uttered from the back of the throat. The Phoenician alphabet adopted both the symbol and the sound, and there were early Greek forms. The classic Greek alphabet discarded it as a letter, however, using only the *kappa* for all forms of *k* sound (see K). The symbol, in the modified

form  (*koppa*), was ultimately used as a numeral for 90. Early Latin (800 B.C.) used this modified symbol as a letter in combination with V to represent the *kw* sound, as we invariably combine Q and U in English. The flowing tail to the letter was evolved from Roman penmanship, and the resemblance of the capital letter to the figure 2, stressed in some forms of handwriting even today, arose from the practice of beginning to describe the circle from the bottom, so as to finish at the tail stroke without taking pen from paper. The derivation of the minuscule *q* is, as usual, due to speed in writing.

Q Seventeenth letter of the English and Latin alphabets. It has the sound of hard *c* (*k*), and in English is always accompanied by *u*, the combination being pronounced as *kw*. Qu also has the simple *k*-sound, especially in French and other foreign words, and in the termination *-que*, as in *grotesque*, *opaque*, where *e* is mute. *Quay* is pronounced *kee*. See Alphabet; Phonetics.

Q. Symbol used for supposed source (Ger. *Quelle*) of the Gospels of Matthew, Mark, and Luke. See Bible.

Qattara Depression. Low-lying area of ground in the N. Libyan desert with a maximum depth below sea-level of about 400 ft. It has an area of 7,500 sq. m., and is bounded on the N. by a steep escarpment of which the scarp face is over 600 ft. in height. The depression protected the left flank of the British line and the right of the German-Italian forces in the battle of Alamein, 1942.

Q-Boat. Name given in the First Great War to a ship used to trap submarines. Also known as mystery ships, Q-boats carried concealed guns that could be unmasked by dropping a flap or letting down the sides of a deck-house.

In equipping a Q-boat all kinds of camouflaging devices were employed to conceal wireless aerials, look-out posts, etc. The boats masqueraded as merchant vessels.

Qisaraya. Coastal village of Palestine, the ancient Caesarea. It is 32 m. N. of Jaffa and close to the Haifa rly. It was founded by Herod, 13 B.C., on the site of an earlier city, and then contained temples and an amphitheatre, as well as a great breakwater, since destroyed, which made a good harbour. Paul spent his two years' imprisonment here. The city became the military headquarters of Palestine, and here Vespasian was proclaimed emperor in A.D. 69. After the fall of

Jerusalem it became the capital of Palestine. In 1102 it was taken and despoiled by the crusaders, and the ancient city was destroyed by the Egyptian Beibars in 1265. The modern village, built on the site, is mainly of value as a port of call for vessels needing water.

Quack. Term used generally for one who falsely professes knowledge—especially medical knowledge—and more strictly for one who disingenuously puffs worthless remedies. The word is an imitation of the noise made by a duck, and alludes to the chatter with which a quack vaunts his skill. It was formerly used for medical impostors only, but was later applied to any charlatan (*q.v.*). In the 20th century it tended to be applied to any medical practitioner not recognized by the General Medical Council. The original form of the word was "quacksalver," one who "quacks" or gabbles in praise of his "salves," ointments, or remedies.

Quadragesima (Lat. *quadragesimus*, fortieth). Latin name for Lent, or for the 40 days' fast before Easter. It denotes the first Sunday in Lent. In the English Prayer Book the word is only used in the Tables and Rules.

Quadrangle. Rectangular or nearly rectangular court enclosed by buildings. The quadrangle was a conventional feature of monastic architecture, the cloisters being a special feature, and was adopted for colleges and large houses; for the latter notably in the Tudor period, as at Hampton Court and Compton Wynyates. At the universities the abbrev. "quad" is applied to the courtyards of colleges even when these are not completely enclosed. Tom Quad at Christ Church, Oxford, is one of the most famous.

Quadrant (Lat. *quadrans*, fourth part). In mathematics, a quarter of a circle: the area bounded by two radii at right angles to one another and that part of the circumference between

them; that part of a circular arc subtending an angle of 90° at the centre; or a circular sector of 90° angle. The distance from the pole to the equator forms a quadrant 6,213.7 m. in circumference.

Quadrant. Instrument for determining angular measurements. Originally designed for astron-

Quadrant formerly used in navigation
By courtesy of Negretti & Zambra

omers, it was later developed for navigation. It consisted of a limb or arc of a circle (90°) equal to the fourth part of the whole circumference, graduated into degrees and parts of degrees. The quadrant was defective owing to the impossibility of securing exactness of the whole arc, perfect stability of the centre piece, and concentricity of the centre of motion with the centre of division. It was superseded by the sextant (*q.v.*), in which the graduated limb is one-sixth of a circle. The quadrant electrometer is an electrostatic instrument invented by Kelvin for measuring differences in potential on the surface of an electrically charged conductor. See Electrometer.

Quadrat. In typography, piece of metal cast lower than the letters and used for spaces between them, and for filling out blank lines. It is usually abbreviated as quad.

In plant ecology, a small square of ground marked out to facilitate the study of the relative numbers and distribution of plants in it.

Quadratic Equation. In mathematics, equations which involve the second power of the unknown quantity. Every quadratic equation can be reduced to the form $x^2 + ax + b = 0$, where x is the unknown quantity and a and b the terms in which its value may be expressed. See Equation.

Quadratrix (Lat. *quadrare*, to square). In mathematics, name given to a type of curves the ordinates of which are a measure of the areas of other curves. One of the most famous of these curves is that called the quadratrix of Dinostratus. It is the plane locus of the intersection of a straight line revolving uniformly about a point and another straight line moving uniformly parallel to a given direction. It was realized that the construction of such a curve, one of the most ancient of transcendental curves, would enable the squaring of the circle, the duplicating of the cube, and the trisection of an angle to be accomplished, the three most famous geometrical problems of the ancients. The quadratrix of Tschirnhausen is a curve with similar properties.

Quadrature. In astronomy, the relative position of two heavenly bodies when their difference of longitude is 90°. The first quarter of the moon is its eastern quadrature, the last its western quadrature. Quadrature of an inferior planet with the sun is impossible, since its maximum elongation is less than 90°.

In mathematics quadrature is the finding of an area equal to a given area. It is usually restricted to the finding of a square equal in area to a given area. Squaring the circle (*q.v.*) was one of the three famous problems of antiquity. The area of any figure bounded by straight lines is easily found, since the figure may be divided into triangles, the areas of which were first demonstrated by Euclid. Areas of figures bounded by curves cannot in general be found. Where the equations of the curves can be stated in algebraic functions, however, the areas can be obtained by the calculus. See Mensuration.

Quadriga. Roman two-wheeled chariot to which four horses were harnessed abreast. It is of frequent occurrence in ancient sculpture, and a famous modern example is on Wellington Arch, at the W. end of Constitution Hill, London. Designed by Adrian Jones (*q.v.*), it was erected in 1912 to commemorate 100 years peace between the U.K. and the U.S.A.

Quadrilateral. Four-sided polygon. Particular kinds of quadrilateral are the square, parallelogram, rhombus, and trapezium. The word usually indicates a figure in one plane, a quadrilateral not in one plane being known as a *gauche* quadrilateral.

Quadrilateral (Lat. *quatuor*, four; *latus*, side). Name used for

four fortresses grouped for strategic purposes. Perhaps the most famous quadrilateral is the one in Lombardy and Venetia, composed of the fortified towns of Peschiera, Mantua, Legnago, and Verona, which enabled the Austrians to maintain their hold on N. Italy. Verona, commanding the Adige valley, allowed supplies to come from Austria, and Mantua was so strongly situated and fortified that it was long deemed impregnable. In 1848 Peschiera fell to the Italians, who then besieged Mantua, but they met with a reverse at Custozza and retreated. After the battle of Solferino, 1859, the French and Italians were bombarding Peschiera, when the peace of Villafranca terminated hostilities. In 1866 the Italians again attempted to capture the quadrilateral, but without success.

Quadrille (It. *squadra*, asquare). Dance which originated in the French ballets of the 18th century, and was later transferred to the ballroom. It is danced by four couples who stand in a square. The music consists of five parts: Le Pantalon, L'Été, La Poule, La Trénise, and Finale, the names being taken from old *contre-danses*. See Dancing.

Quadrille. Obsolete card game. It is an offshoot of *ombre* (*q.v.*), and is played by four persons with 40 cards, the 8, 9, and 10 of each suit being eliminated from the pack.

Quadrirème. Ancient war vessel. It was propelled by four banks of oars, one above the other. See Trireme.

Quadroon (Span. *cuarteron*; from Lat. *quartus*, fourth). Term applied generally to one who has one-fourth Negro blood—the offspring of a white and a mulatto. It is sometimes applied to a person who is fourth in descent from a Negro ancestor, provided that one of the parents in each generation has been white; the person who is third in descent being known as a *terceron*. The Spaniards early used the word for the offspring of a white and an Indian half-breed, and it is sometimes applied to similar crossings in other races, and also to animals and plants. See Negro.

Quadrumvirs. Title given to the four fascists who led Mussolini's march on Rome in 1922. They were Bianchi, Vecchi, Italo Balbo (*q.v.*), and Emilio de Bono (*q.v.*). Balbo was leader of the volunteer fascist army and de Bono commander of the militia. Vecchi became a monk after the fall of fascism.

Quadruple Alliance (Lat. *quadruplus*, fourfold). Alliance of four countries. Such was the treaty of 1718 by which Great Britain, the Netherlands, France, and the Holy Roman Empire signed an agreement to uphold the treaty of Utrecht against the aggressive policy then pursued by Spain. Another quadruple alliance was signed in 1834 by Great Britain, France, Spain, and Portugal, with the object of keeping Dom Miguel from the throne of Portugal.

Quadruplet. Musical term for an abnormal group of four equal notes. It is performed in the time of three or six of the same nominal value.

Quadruplets. Four young produced at a birth. Human quadruplets are rare, and in Great Britain only 15 sets were born between 1935 and 1948.

Quaestor (from Lat. *quaerere*, to ask, inquire). Magistrate of ancient Rome. Their number was originally two, but by the last period of the republic it had increased to 40. Under the empire the number was reduced to 20. At the inception of the office the quaestors had legal duties in connexion with inquisition into murder charges, but this function passed to the aediles and tribunes. Latterly, the quaestors were financial and administrative officers. The quaestorship was the lowest of the higher magistracies, whose holders were entitled to a seat in the senate after their year of office.

Quagga. Name formerly applied to a dark variety of zebra, once common in Cape Colony. It became extinct about 1870. The name was onomatopoeic, being the natives' reproduction (*quā-hā*) of the animal's barklike neigh "*quā-hā-hā*"; it was applied by them to zebras in general. It is now believed that the supposed *Equus quagga* was only a local race of the common zebra (*E. zebra*), Burchell's zebra (*E. burchelli*), or Chapman's zebra, with darker upper parts, the legs and under parts white and free from stripes, and the sides spotted. See Zebra.

Quaidi Azam. Title, meaning great leader, given in the dominion of Pakistan to its first gov.-gen., Mohammed Ali Jinnah (*q.v.*).

Quai d'Orsay. Thoroughfare in Paris running for nearly 2 m. along the N. side of the Seine, from the Champ de Mars to the Pont

Royal. The many government offices situated along it, including the foreign office, make it the Whitehall of France, and Quai d'Orsay is used at times as a synonym for the French government. *Pron.* Kay dorsay.

Quail (*Coturnix coturnix*). Small game bird about the size of a thrush. Closely related to the

pheasant and partridge, it is a native of Europe, Asia, and N. Africa. It is a fairly regular visitor, but in variable numbers, to the British Isles, breeding in many localities, mostly departing before winter. It is much like a diminutive partridge in shape and general coloration, and seeks its food under cover of the field crops. The nest is a slight grass-lined depression in the ground, and contains seven to ten brown-blotched, buff-tinted eggs. The alarm note is a "whit-whit-whit." Vast numbers are netted in the Mediterranean countries during the spring migration, and exported alive for food. There are five other species, natives of E. Asia, Australasia, and Africa. In 1937 it was made illegal to import live quails into the U.K.

Quain, SIR RICHARD (1816-98). British physician. Born at Mallow, co. Cork, Oct. 30, 1816, he became house surgeon at University College Hospital, London, 1840, and physician to Brompton chest hospital, 1855-75. In 1863 he was put on the general medical council, and was its president for 1891, and he was made a baronet. He was the editor of the Dictionary of Medicine, 1882, and died March 13, 1898.

Richard Quain (1800-87), his cousin, was president of the Royal College of Surgeons, 1868, and one of its original members. Jones Quain (1796-1865), another cousin, was author of Elements of Descriptive and Practical Anatomy, first published 1828 and long a standard work. The name Quain is perpetuated in chairs of physics and literature at London university.

Quakers. Popular name for the Society of Friends. Its original derisive reference to the bodily tremors of members of the society when moved by the Spirit in public worship has long disappeared. *See* Fox, George; Society of Friends.

Quaking Grass (*Brizia media*) or TOTTER-GRASS. Perennial grass of the family Gramineae. It is

a native of Europe, Asia, and Africa. It has creeping, underground stems and flat leaves. The flowering stems are much branched, and each of the flattened, oval, more or less purple and shining spikes is borne on a long, hair-like, trembling stalk. A smaller species (*B. minor*) has tufted stems, and is an annual. *See* Grass illus.

Quail, a game bird which breeds in the British Isles

Quality (Lat. *qualitas*, from *qualis*, of what kind?). In the widest sense, attribute as opposed to substance, all that can be affirmed of a being regarded as subject; in a narrower sense, a particular kind of attribute which leads to a

substance being included in a certain class. Qualities have been distinguished as primary, such as are found everywhere in matter (extension, solidity, figure, motion or rest, number), and secondary, such as are not necessarily inseparable from matter (colour, taste, warmth, smell), but depend upon the action of the primary qualities. In psychology, quality is the characteristic whereby one sensation is distinguished from every other.

Quality Street. Comedy by J. M. Barrie. Produced Sept. 17, 1902, at the Vaudeville Theatre, London, it had a run of 459 performances. The story, which is set in the early 19th century, deals charmingly with two sisters who are reduced to keeping a school. Ellaline Terriss, Marion Terry, and Seymour Hicks played the leading parts.

Quamash (*Camassia quamash*). Bulbous perennial of the family Liliaceae, native of N.W. America. It has narrow leaves about a foot long, and a stout flowering stem bearing a spray of six-parted blue flowers. After the plants have flowered, the natives dig up the bulbs and dry them by heat, when they are pounded into cakes for use as food.

Quandary Peak. Mountain of the U.S.A., in the state of Colorado. Situated in the Park range, it rises to 14,266 ft.

Quantity (Lat. *quantus*, how much?). Literally, the amount of anything. In metre it is the length of a syllable, a false quantity being an error in such length. In logic it means the extent of a conception, and in music the relative duration of a tone. In mathematics a quan-

tity is anything that can be increased or divided or measured. *See* Weights and Measures.

Quantity Surveyor. One who estimates from an architect's drawings the total quantity of materials required for a building, and draws out a list of the exact amounts of the respective materials for the builder to price them and the cost of the labour to carry out the work. The Institute of Quantity Surveyors is a professional society, incorporated 1936, with its headquarters at 98, Gloucester Place, W.1.

Quantock Hills. Range in Somerset, England. It trends for 8 m. N.W. from a point N. of Bishop's Lydeard to the Bristol Channel, 2 m. E. of Watchet. The culminating summit is Wills Neck, 1,262 ft. high.

Quantum Mechanics. This term was originally reserved for Heisenberg's form (1925) of the quantum theory. In a wider sense it now also includes Schrödinger's wave mechanics (1926). Forced by the experimental evidence of discrete spectral lines which point to discontinuous changes in the energy of emitting atoms, Heisenberg abandoned the commutative law of multiplication and postulated that with conjugate dynamical variables like coordinate q and momentum p in the same direction, $qp - pq$ does not equal 0, but 2π times Planck's constant h . This is, of course, only possible if q and p are not ordinary numbers, but more complex mathematical entities, e.g. matrices. Heisenberg showed that the energy values of the electron in the hydrogen atom turn out to be discretely spaced. Such a profound change in the conception of the nature of dynamical variables has far-reaching consequences. From the philosophical point of view the most important is Heisenberg's "uncertainty relation," which sets a limit to the accuracy with which two conjugate dynamical variables can be measured simultaneously, the product of the two uncertainties never being less than Planck's constant.

Other conclusions are more easily reached via Schrödinger's form of the theory. Schrödinger showed that just as in optics the description in terms of rays can be refined into a wave theory covering the finer phenomena of diffraction, so ordinary mechanics can be derived from a "wave mechanics" that accounts automatically for the quantisation of energy in the hydrogen atom.

Davisson and Germer demonstrated electron diffraction by crystals in 1927.

The physical interpretation of Schrödinger's theory is in terms of probabilities. When, for example, a wave crosses into a different medium it is partly reflected and partly transmitted. Similarly, of a beam of electrons striking an obstacle, a certain fraction is reflected and the rest transmitted. The finite probability that an electron bound in a metal may yet escape from it facilitates the well known thermionic emission while, with α -particles in atomic nuclei, this same important "tunnel effect" constitutes the natural radioactive α -decay. Direct use of the wave properties of electrons is made in the "electron-ray diagrams" of crystals and in the powerful electron-microscope.

Schrödinger's form of the theory also explains the nature and strength of the homopolar binding of two neutral atoms in the hydrogen molecule. In the presence of another atom the electron can no longer be thought of as definitely belonging to its own nucleus, there being a finite probability for the exchange of the two electrons between the two nuclei, which are thus kept together (exchange force). Similar forces which naturally lead to "saturation" are probably at play in the binding of protons and neutrons in the nucleus. A further postulate in this connexion is that in an atom no two electrons can be in exactly the same state of motion and spin (Pauli's exclusion principle). This principle is indeed at the very root of the periodic structure of the system of chemical elements, the erstwhile mystical numbers 2, 8, 16, 32 of the elements in the different periods simply being the four lowest values of the $2n^2$ with integral n , as required when the exclusion principle is conjoined with quantum mechanics.

Quantum mechanics has been successful in elucidating the structure and forces in atomic nuclei. Extension of its methods also gives a good account of the corpuscular properties of light (photo-electric effect). It has led to valuable results in the problem of the interaction of light and matter, and indeed of all known particles, albeit only to a degree.

Quantum Theory. Physical theory of radiation first enunciated by Max Planck (*q.v.*) in 1900. The classical theory, which assumed that the energy in electromagnetic waves was continuous and hence

could be subdivided indefinitely, failed to account for the observed distribution of energy in "black body radiation," or the heat and light waves emitted from a small hole in an otherwise closed cavity, at any particular temperature. Planck suggested instead that radiant energy could exist only in multiples of a small unit or quantum. All the quanta of a particular wavelength are identical, but the energy of these is directly proportional to the frequency of the radiation. Thus visible light has a frequency millions of times higher than the shortest wireless waves; hence the energy of its quanta is millions of times greater. The word photon (*Gr.*, light) is often used as a synonym for quantum, and photons are found to behave rather like the molecules of a gas, except that one photon cannot be distinguished from another. The mathematical expression of Planck's theory is contained in the statement $E=h\nu$, where E is the energy, h is Planck's constant equal to 6.55×10^{-27} joules per second, and ν is the frequency of the radiation.

Quanza. Variant spelling of the West African river Kwanza (*q.v.*).

Quarantine (*Fr. quarantaine*, period of 40 days). Period during which ships, goods, or persons coming from countries where infectious disease prevails are interdicted from communication with the shore. The term is derived from the fact that usually the period was made to cover 40 days. Originally instituted as a protection against the importation of plague, and later employed as a defence against cholera and yellow fever, quarantine in the old sense is now abolished in Great Britain, the Quarantine Act of 1825, which embodied the earlier regulations on the subject, having been repealed. The Public Health Act, 1936, gives the minister of Health power to make regulations (after consultation with the board of Trade or the ministry of Civil Aviation) to prevent danger to public health from vessels or aircraft arriving in the U.K. and to prevent infection being carried by vessels or aircraft leaving the country. There are many international conventions regarding these matters. There are also, in Great Britain, regulations under which dogs imported from abroad are kept in quarantine for a definite period.

Quaritch. Name of a British family of booksellers. Bernard Quaritch, the founder, was born

at Worbis, in Saxony, of Slavonic origin, April 23, 1819. He settled in London in 1842 and was naturalised in 1847. Quaritch started as a second-hand bookseller at Castle Street, Leicester Square, removing in 1860 to Piccadilly, where he made his business one of the chief book buying centres of the world. He was a book collector of fine discrimination who paid record prices for rarities. The early editions of FitzGerald's Omar Khayyám were published by him. He died at Hampstead, Dec. 17, 1899.

His son, Bernard Alfred, was born Jan. 13, 1871, and educated at Charterhouse, joining the family business in 1889. In 1907 he moved to Grafton Street, and died Aug. 27, 1913.

Quarles, FRANCIS (1592-1644). English poet. Born at Romford, Essex, May 8, 1592, he was educated at Christ's College, Cambridge. Appointed in 1613 cup-bearer to Elizabeth of Bohemia, daughter of James I, he accompanied her to Germany. Secretary to Archbishop Ussher in 1629, he was chronologer to the city of London from 1639 until his death, Sept. 8, 1644. He was buried in the church of St. Olave, Silver Street. A Royalist, who wrote several pamphlets denouncing parliament, Quarles is best remembered by his Emblems (moral and religious verse), 1635, and especially by his prose *Enchiridion*, 1641, a collection of essays and aphorisms. While one of the metaphysical poets, full of strained conceits, and something of a Puritan, he possessed a lively fancy and much felicity of expression.

Quarnero, GULF OF. Arm of the Adriatic Sea. E. of the peninsula of Istria, Italy, it stretches to the shore of Croatia, Yugoslavia, and contains the islands of Krk, Rab, Cherso, and Lussin. Fiume is the only good harbour on the entire coast.

Quarrying. Removal of portions of rock from open pits or caverns cut in the earth for that purpose. The word quarry, and its French equivalent *carrière*, are connected with the Lat. *quadratus*, squared, denoting a quarry as a place from which squared stones are cut.

Methods of quarrying depend mainly on the position of the rock, its hardness, its structure, and the purpose for which it is required. A hill slope is the best site for a quarry, for its floor is not then sunk below the general surface of the ground, and there is no diffi-

culty in raising the cut stone. Since the stone, when required for building, must be cut out in blocks, use is made of natural planes of weakness, such as bedding planes, joints, or cleavage; but where no such natural joints exist, the rock has to be cut. To do this, lines of holes are made with picks, and wedges driven into them until the rock splits. Another method is to drill holes elongated in the direction of the proposed cut, and to charge them with explosives. Blasting, however, must be conducted with great care when building stones are concerned, lest it shatter the rock. High explosives are used for blasting hard rocks when large quantities of material are required, and the size of the blocks is unimportant, as when road stone is quarried.

The plan on which the quarry is opened is important, and in many large quarries the stone is cut out so that the face of the quarry, *i.e.* the cut surface of the rock, is stepped or terraced. This method allows the quarrying to proceed simultaneously at several levels, and prevents dangerous falls of overhanging rock. In order that several gangs of men may work at once, the so-called stepped long-walled method is often adopted, the face of each terrace being cut in several vertical planes, each a little farther back than the last, so that each successive vertical layer has one free end, and a gang of men can be employed on each "wall." The blocks of stone are generally lifted out of the quarry with cranes, and carried to a convenient rly. or harbour by trucks run on rails, though sometimes the material is carted away, or is let down a hill slope with rope gear.

Slate, a sedimentary clayey stone, is obtained from open quarries or mines according to the position of the deposit and the nature of the overburden. The treatment of the rock is distinct only in that the cleavage planes do not necessarily coincide with the natural bedding planes or planes or layers on which the deposit was formed. The cleavage planes arose with heat and lateral pressure. Blocks are split along these layers to obtain the thin slabs of roofing material which is the commonest use of slate. *See* Building; Marble; Mason; Stone.

Quart. British measure of liquid capacity, the fourth part of a gallon. It contains 69·3185 cub. ins., or 2½ lb. of distilled water. The old English quart for wine

contained 57·75 cub. ins. and for beer 70·5 cub. ins. In the U.S.A. the quart contains 67·2 cub. ins. The reputed quart was a bottle, used for the sale of ale and nominally containing one fourth of a gallon, but, in fact, containing only one-sixth or less. Since the introduction of regulations enforcing the use of true weights and measures, the reputed quart bottle may be used only if it bears a label stating its true capacity.

Quartan Fever. Form of malaria in which two days intervene between consecutive attacks. The attacks, therefore, follow each other on the fourth day from the beginning of the previous attack. *See* Malaria.

Quarter. As a measure of weight or capacity, the fourth part of a larger measure, *e.g.* 28 lb. is the quarter of a hundredweight. It is generally used for corn measure, when it equals eight bushels. The four principal points of the compass are known as the four quarters. In the plural the term is used for the place where soldiers are accommodated (hence quarter-master).

From this probably comes the phrase to give quarter, *i.e.* to show mercy, implying that the vanquished man will be sent to the soldiers' quarters instead of being killed. Formerly a garrison which refused to surrender could be refused quarter; but under the Hague Regulations, belligerents may not declare that no quarter will be given. Persons who continue to fire after surrendering may be refused quarter. At sea a vessel which hauls down her flag is entitled to quarter.

Nautically, the quarter is that part of the ship's side situated between the mainmast and the stern. *See* Moon

Quarter Days. In England, the days which mark the four quarters of the year for such matters as paying rent, etc. They are Lady day, March 25; midsummer day, June 24; Michaelmas, Sept. 29; and Christmas, Dec. 25. Half-quarter days are Candlemas, Feb. 2; May 9; Aug. 11; and Martinmas, Nov. 11.

Quarterdeck. After-deck of a warship. It is set apart for the officers, whose cabins are generally on the decks below it, and hence arises the use of the term quarterdeck as a synonym for the commissioned officers of the navy. In pre-Reformation days a crucifix stood on the quarterdeck, and to this everyone used to do reverence when going to that part of the

ship. From this arose the custom of saluting the quarterdeck, which still survives in the British navy.

Quartering. In heraldry, a method of marshalling (*q.v.*) whereby two or more coats-of-

Quartering in heraldry

arms are shown on one shield. In the simplest form when two coats are concerned, the principal one, usually the paternal arms, is placed in the first and fourth quarters, and the other in the second and third. If there are three coats, the principal one again occupies the first and fourth quarters, and the others respectively the second and third. There may be four coats, five, or even many more, but how ever many the divisions, it is still called a "quartered shield." Usually divisions are of an even number, the principal coat being repeated in the last quarter if necessary. But quartering by uneven numbers is often met with. Moreover, one of the coats to be introduced may already be quartered, which is then known as "grand quarter." Impaled quarters are also seen.

Quartering is the term applied in woodwork to strips of wood of any length, but square in section, *e.g.* 2-in. quartering, etc.

Quarterly Review. THE. British monthly periodical, devoted chiefly to politics, history, literature, and art. It was projected by John Murray and Sir Walter Scott in opposition to The Edinburgh Review, which had become a purely Whig organ. The first number appeared in Feb., 1809. William Gifford (*q.v.*) was editor, 1809-24, and among early contributors were Scott, Southey, Canning, Croker, and Heber. Salisbury and Gladstone later wrote for the review at the same time (not on politics). Mingling party politics with literary criticism, The Quarterly has always been a staunch supporter of the Tory or Conservative cause. After the brief editorship of Sir J. T. Coleridge, J. G. Lockhart (*q.v.*) conducted The Quarterly, 1825-53; Sir William Smith, 1867-93; R. E. Prothero (Lord Ernle) and G. W. Prothero, 1899-1922; then Sir John Murray until 1928, and from then his son, also Sir John.

Quartermaine, LEON (b. 1876). British actor. Born at Richmond, Surrey, Sept. 24, 1876, he was edu-

cated at Whitgift grammar school, and first appeared on the stage at Sheffield, 1894. After touring with Ben Greet's company, and with Martin Harvey in *The Only Way*, he came to London (Comedy Theatre) in 1900, and played in New York three years later. His greatest successes were perhaps soon after the First Great War in *Mary Rose*, *The Circle*, *Secrets*, and as *Ishak* in *Hassan*; then came *The Man with a Load of Mischief*, 1924. He gave memorable performances as *Malvolio* in *Twelfth Night*, 1933; *Charles Randolph* in *Dear Octopus*, 1938; *Coade* in *Dear Brutus*, 1941; *Scandal* in *Love for Love*, 1943.

Quartermaster. Regimental officer generally with the rank of lieutenant, though he may be of higher rank. He assists the commanding officer to provision and clothe the unit. He receives, issues, and accounts for rations, stores, and ammunition. The post carries a special rate of pay, and is permanent. Being a commissioned officer, the quartermaster is a member of the officers' mess. He is assisted by N.C.O.s called quartermaster-serjeants (Q.M.S.).

The word quartermaster also occurs in ranks of higher grade, e.g. quartermaster-general (Q.M.G.), a general officer in charge of the supply departments of the army, having under him assistant quartermasters-general (A.Q.M.G.).

In the merchant service, a quartermaster is a petty officer qualified to take the wheel and keep a ship on her course under the supervision of a navigating officer.

Quartern. Old English term for a measure of capacity, like the fourth part of a pint, the fourth of a peck or stone. The reputed 4-lb. loaf of bread is generally known as a quartern loaf.

Quarter Sessions. English court of law, so called because it usually meets four times a year. In the counties it consists of the justices of the peace, and they appoint two of their number as chairman and vice-chairman respectively. Certain cities and boroughs have also a court of quarter sessions, presided over by the recorder.

These courts hear appeals from the ordinary magistrates' courts and also appeals about rating and licensing matters, but have little other civil jurisdiction. As courts of first instance they try indictable offences of many kinds, but not treason, libel, or homicide. From their decision a convicted person can appeal to the court of criminal appeal, except when quarter ses-

sions sits solely as a court of appeal from a summary jurisdiction.

Quarter sessions arose in England in the 14th century owing to the fact that the magistrates were ordered to meet four times a year to discharge the business of the county. For this purpose the magistrates meeting in quarter sessions were the sole authority until the establishment of the county councils in 1888.

Quarter-staff. Weapon formerly much used by the English. It was a staff about 1½ ins. in dia-

Quarter-staff, as used in medieval England. From a print illustrating the fight between Robin Hood and the Tanner

meter, from 6 ft. to 8 ft. in length, and tipped with iron at each end. It was grasped in the middle by one hand and by the other a quarter way along, now at one end and now at the other, as policy dictated, the shifting of the hand giving it a circular play. Contests with the quarter-staff once formed a regular feature of rustic gatherings in England.

Quartet. Musical composition written for four solo voices or instruments. The former may be for male or female voices alone, or for any combination of the two, the most usual being for soprano, alto, tenor, and bass; the latter, in most instances, is for strings alone, consisting of 1st and 2nd violins, viola, and violoncello. This combination has attracted most of the great composers. There are examples of the combination of wind and string instruments. Occasionally the pianoforte is used and the 2nd violin omitted; this is known as a piano quartet, the finest examples being by Brahms. The term is also used of the performers collectively.

Quartier Latin (Fr., Latin quarter). District of Paris, south of the Seine. It contains the Sorbonne and was early a resort of scholars, its name being due to the fact that Latin was their usual speech. Later it became noted as the resort of students of art.

Quarto (from Lat. *quartus*, fourth). Term used of paper when a sheet is folded twice, making four leaves or eight pages, abbreviated as 4to; it is applied to books a size smaller than folio, or usually 9½ ins. by 12 ins. A quarto is also an Italian dry measure equalling a little over two bushels, and in Portugal a liquid measure holding nearly 3½ litres. See *Folio*.

Quartz. Natural crystalline form of silicon dioxide, SiO₂. It occurs as grains, massive or in hexagonal prisms with pyramidal terminations. Quartz is hard, translucent or transparent, and the crystals vary in colour from clear colourless (rock crystal) to smoky brown (Cairngorm) and black; the clear purple variety is known as amethyst and the yellow as false topaz or citrine. Cryptocrystalline varieties include chalcedony, carnelian, prase, agate, onyx, sardonyx, flint, jasper, etc. Quartz is widely distributed as irregular grains in rocks, forming the essential constituent in sandstone, quartzites, and arenaceous rocks in general; it also occurs in granite and other igneous and metamorphic rocks. The massive and crystal forms are found in veins and fissures often contributing to the gangue of metalliferous deposits.

Quartz is used in mortar and cement; as a flux in metallurgy; in the manufacture of glass and silica brick; in abrasives; as a filler; and for other purposes. Quartzite and sandstone are widely employed as building stone. The crystalline varieties are used in jewelry, whilst the best rock crystal is fused to make special optical lenses and prisms, drawn into threads for use in highly sensitive instruments. The most important use of crystalline quartz is based on its piezoelectric properties: when an orientated section of a selected crystal is subjected to pressure it becomes electrified, and conversely an applied charge causes distortion of the slab. Piezoelectric sections detect extremely delicate changes of pressure in depth-sounding apparatus, and measure high pressures resulting from artillery or bomb explosions. The principle is also applied in radio. The chief producer of piezoelectric quartz is Brazil.

Quartzite. In geology, the name given to a metamorphic rock composed chiefly of quartz. It is the result of alteration of sandstone by the accretion of

silica round the original sand grains and the solidification of the whole sandstone into a dense vitreous rock.

Quash. Legal term. In English criminal law, if an appeal against conviction succeeds, the latter is quashed, *i.e.* annulled. An indictment may also be quashed because of some defect in it. If the whole body of a jury is successfully challenged (challenge to the array), the array is quashed.

Quasimodo. Name of the hunchback foundling bellringer in Victor Hugo's novel *Notre Dame de Paris*. He was found on Low Sunday, the first Sunday after Easter, which is called Quasi Modo from a hymn sung on that day. (*Quasi modo geniti infantes*, *As new-born babes*).

Quasi-Optical Waves OR QUASI-VISUAL WAVES. Name often given to electro-magnetic waves (also known as metric waves) of lengths below 10 metres (corresponding to frequencies above 30 megacycles per second), on account of certain resemblances between their behaviour and that of the much shorter electro-magnetic waves associated with visible light. Light waves normally follow straight line courses, and to the inhabitants of the earth the horizon marks the limits of the range at which objects on its surface can be seen.

Quasi-optical waves are now largely used for short-range radio transmission, including frequency-modulated broadcasting, for television, and for radar. Most textbooks published before 1939 state or imply that the range of transmission on these wavelengths is little beyond the horizon visible to the eye from the transmitting aerial. Instances reported of reception at vastly greater ranges were put down to freak conditions. During the Second Great War enormous use was made of quasi-optical waves, for radar. The scientific study of their behaviour has since been intensified.

It used to be held that their only possible path was ordinarily the direct, or straight line, from transmitting to receiving aerial, and that, unlike other radio waves, they were not reflected back to earth by any layer in the atmosphere. It is now known that besides the direct or visual path these waves may follow one or more of three paths because of reflection of one kind or another.

One of these reflectors is the "atmospheric duct," a common occurrence in settled weather.

Under such conditions the temperature may not show its expected decrease with height—it may even increase; there may also be an abnormally rapid decrease with height in the water-vapour content of the air. Thus is formed a kind of conduit for the waves. Its upper wall may be only a few yards above the surface of the ground, and the waves are thus bent to follow the contours of the earth for distances up to 150 miles.

Secondly, at times near a sunspot maximum the F-layer, through which such waves ordinarily pass, may become so strongly ionised that it reflects them back to earth at great distances. Such conditions were observed in the autumn of 1947, when police radio and other transmissions from the U.S.A. caused severe daily interference with the London television. F-layer reflections of metric waves have been recorded at ranges up to 5,000 miles.

The third cause of long-range travel by quasi-optical waves is known as "sporadic-E." In summer strong sunlight may cause a super-ionisation of odd patches of the E or Heaviside layer, and metric waves, which normally penetrate that layer, may be reflected back to earth at ranges up to 1,000 m. and more.

Quassia (*Quassia amara*). Tree of the family Simarubaceae, native of tropical America. Alternate

Quassia. Leaves and tubular flowers of the Surinam variety

leaves are broken up into a double row of leaflets, not unlike those of the ash. The large, tubular, scarlet flowers are clustered. The wood is intensely bitter, and was formerly used as a tonic and in dysentery, but the quassia of modern medicine is furnished by an allied tree (*Picraena excelsa*), a native of Jamaica, whose timber is exported in the shape of logs.

Quatermain, ALLAN. Adventurous and mystic character in

four novels by Rider Haggard (*q.v.*). A combination of scholar and "leatherstocking," he is the central figure in King Solomon's Mines (1885); Allan Quatermain (1887); Allan's Wife (1890); She and Allan (1921).

Quaternary. In geology, name given to the latest of the main time-periods, *i.e.* the one following the Tertiary. It includes the present day. It is estimated as having begun about 1,000,000 years ago, and is subdivided into two systems, (1) Pleistocene, and (2) Recent, or Holocene. The earlier Pleistocene was remarkable for the widespread development of glaciers and ice-sheets, and is often referred to as the Ice Age or Glacial Period. The ice spread from centres of snow accumulation and covered much of the N. hemisphere in Europe and America. The Antarctic ice-sheet was also thicker and more widespread than now. In mountainous districts in lower latitudes (*e.g.* Alps, Himalayas) glaciers descended further and even flowed out on to the surrounding plains. In the Alps four cold glacial and warm inter-glacial stages have been recognized, but in Great Britain only two are known.

Pleistocene deposits include boulder clay and material washed out in front of the glaciers by melt water. Coombe rock, raised beaches, river terraces, gravels, and alluvium were also formed and deposited at this time. The extensive peat deposits of Scotland, N. England, etc., were formed after the glaciers retreated. When the ice melted its weight was removed from parts of the continents, which have in consequence been steadily rising ever since. In Scandinavia this uplift has amounted to 850 ft. above present sea-level.

Evidence of the existence of man and his early ancestors is first found in the early Quaternary deposits. This consists of artefacts or stone implements, which are also associated with fossils of many animals, some now extinct. Remains of mammoth, rhinoceros, Irish elk, musk ox, etc., have been found in the Thames gravels. Elsewhere in deposits found in caves, particularly Kent's Cavern near Torquay, occur hyaena and sabre-toothed tiger. *See* Fossil; Geology; Ice Age. *Consult* The Quaternary Ice Age, W. B. Wright, 1936.

Quaternions. Branch of mathematics invented by Sir W. R. Hamilton. It is an analytic method

which places a new interpretation on imaginary algebraic quantities, generalising directions in space. Such directions are commonly referred to the coordinate axes of Descartes, and expressed in terms of Cartesian coordinates. From the point of view of geometry the method of quaternions is an extension of Cartesian geometry, which gets rid of coordinate axes and treats all directions in space on the same terms, and a quaternion may be regarded as a factor or operator of two directed lines in space which changes one of these directed lines into another. The symmetry of an analytic method applicable to a space of three dimensions made Hamiltonian quaternions of the utmost value in solving problems in physics, such as are connected with heat conduction, electric potential, etc. To change the length and direction of a line involves four distinct numbers, and for this reason Hamilton called the operator bringing about the change a quaternion.

Quatorzain (Fr. *quatorze*, fourteen). In English literature, a poem of 14 rhymed iambic pentameter lines. It is often confused with the sonnet (*q.v.*), by the rigid laws of which form it is not bound. The quatorzain is divided into three quatrains of alternate rhymes, which may, but need not, be the same in the successive quatrains, and a final rhymed couplet, which the strict sonnet never has. Most of the Elizabethan "sonnets" are really quatorzains, and in spite of the efforts of the purists the mistake has been perpetuated.

Quatrain (Fr. *quatre*, four). Complete expression of a single thought in four rhymed lines of whatever measure and arrangement. The quatrain is especially apt to the epigram. The lines written by the earl of Rochester (1647-80) on King Charles II's bedchamber door are an example:

Here lies our sovereign lord the King,
Whose word no man relies on;
He never says a foolish thing,
Nor ever does a wise one.

Quatre Bras. Village of Belgium, in the prov. of Brabant. Its name comes from its position at the meeting of the Brussels-Charleroi and Namur-Nivelles main roads, $2\frac{1}{2}$ m. S. of Genappe. It is famous as the scene of the battle of June 16, 1815, preceding the battle

of Waterloo. In pursuance of his intention of destroying the British and Prussian armies separately, Napoleon ordered Ney to attack

Quatre Bras, Belgium. House where the duke of Brunswick, who commanded the Hanoverian troops, died of his wounds. Top, right, the village, at the cross-roads

the former at Quatre Bras while he engaged Blücher at Ligny. The marshal was slow in carrying out the order, and it was afternoon before he attacked the Dutch and Belgians under the prince of Orange. Wellington, in Brussels, hurried up some British troops, and their arrival prevented the French from scoring a success, but the fight, in which the British and their allies lost 4,500 men, was a very sanguinary and stubborn one. Towards evening, Wellington ordered a general advance which swept the French from their positions, but he was unable to reap the full fruits of his victory on account of the necessity of connecting with Blücher, who was retreating from Ligny. See Blücher; Napoleonic Campaigns; Ney; Waterloo; Wellington.

Quatrefages de Bréau, JEAN LOUIS ARMAND DE (1810-92). French anthropologist and zoologist. Born near Valleraugue, Gard, Feb. 10, 1810, he studied medicine at Strasbourg, practised and taught at Toulouse, 1838, removed to Paris, 1840, and became professor of anatomy and ethnology at the Natural History Museum, 1855. He was hon. F.R.S., 1879. His works include *The Polynesians and Their Migrations*, 1866; and an *Atlas of Human Crania*, 1875-82. There are Eng. trans. of *Metamorphoses of Man and the Lower Ani-*

mals, 1864; *The Prussian Race*, 1872; *The Human Species*, 1879; *The Pygmies*, 1895. He died in Paris, Jan. 12, 1892.

Quatrefoil (Fr. *quatre*, four; *feuille*, leaf). In architecture, an opening in tracery consisting of four lobes tangent to the inner side of a circle and meeting each other at cusps within the circle. Square panels inscribed with a quatrefoil are a common ornament in Gothic architecture. See Cinquefoil; Cusp.

Quatremère, ETIENNE MARC (1782-1857).

Quatrefoil, architectural examples

French Orientalist. After studying at the Collège de France, he became professor of Greek at Rouen, 1809, and of Hebrew at the Collège de France ten years later. In 1838 he was appointed professor of Persian. He was the first to prove the derivation of Coptic from ancient Egyptian, and his many philological and historical works are valuable.

Quatremère de Quincy, ANTOINE CHRYSOSTOME (1755-1849). French archaeologist. A staunch upholder of the Revolution, he occupied several responsible posts under the republic and empire. As intendant of arts and public monuments, 1815, he did much to preserve the archaeological remains of France, and wrote numerous works on architecture and art.

Quaver. Musical note represented thus: , its value being one-eighth of a semibreve. Two or more quavers may be grouped thus: . Its corresponding rest is . So far as can be learned, the quaver was invented during the

15th century, being known at first as Chroma, Fusa, or Unca, and later as the Lesser Semiminim. In America and Germany it is called an eighth note, in France a crook or hook (croche).

Quay. Embarkation and landing place, formed alongside a river or sea, or in a dock or harbour, against which ships may berth. There is no clear distinction between a quay and a wharf, but the former term is generally applied where a long stretch of river or sea shore is embanked by a masonry wall for the purpose above defined, or where a dock wall or masonry mole or breakwater provides shipping accommodation and facilities. A short coaling wharf on a river bank supported by piles would not be called a quay. Quays are usually equipped with appliances for the loading and unloading of ships, and carry railway and road traffic. Their length or area is known as quayage. *See Dock; Harbour; London, Port of. Prom. kee.*

Queanbeyan. Town of New South Wales, Australia, in Murray co. It is 55 m. by rly. S.S.W. of Goulburn, on the Queanbeyan river. It is the rly. junction for Canberra. Pop. 4,019.

Quebec. Largest of the nine provinces of Canada. Its area is 594,860 sq. m., of which 523,860 sq. m. are land. The population (1948 est.) is 3,792,000. More than three-quarters are of French descent. Quebec is the capital, but Montreal is much the largest city. In 1927 the Labrador peninsula was transferred to Newfoundland.

Broadly speaking, Quebec consists of two parts. The smaller and more settled is the original Canada, a narrow belt on either side of the St. Lawrence from below Quebec to just above Montreal. The larger is an area which includes part of the peninsula lying between Hudson Bay and the Atlantic, from which it is separated by Labrador. The N. part, the former territory of Ungava, was added in 1912.

The prov. is flat, little more than one immense plateau with nothing higher than 2,000 ft., although on the S. of the river there are hills rising to nearly 4,000 ft. Its rivers, excluding the St. Lawrence, are not long. From a watershed almost in the centre of the prov. they flow in all directions; S. into the St.

Lawrence, W. into Hudson Bay, N. into Ungava Bay, and E. through Labrador into the Atlantic. Others come from the U.S.A. to fall into the St. Lawrence. Lakes abound, Mistassini and St. John being the

Quebec, Canada. Memorial in the city to Jacques Cartier

largest. The largest island is Anticosti at the mouth of the St. Lawrence.

Quebec produces wheat, barley, oats, and cereals, but is more famous for its horses, cattle, and sheep. Dairying is largely practised, cheese and butter being the principal products, and there is tobacco growing on a considerable scale. Mineral production increased from \$25,000,000 in 1926 to \$104,000,000 in 1942. From the prov. the world obtains some 70 p.c. of its asbestos. Much land is covered with forests, and lumbering is an important industry, as is the production of pulpwood. For the industries water power is abundant. The St. Lawrence is the great highway, except in winter. The more populous parts are well served with rlys., both steam and electric. Montreal and Quebec are on the three transcontinental lines, and also in direct connexion with the various U.S.A. railroad systems.

In the Dominion parliament Quebec is represented by 65 members. Its local affairs are under a lieut.-gov., a premier and cabinet, and the legislature, with a council of 24 nominated and an assembly of 81 elected members. By the Quebec Act the R.C. Church obtained freedom of worship. Separate systems of public education for the Protestants and for the Roman Catholics are carried on. There are two Protestant universities, McGill (Montreal) and

Bishop's (Lennoxville), and two R.C. ones, Laval (Quebec city) and Montreal. It is the only province where liquor may be served with meals.

The early history of Quebec is really that of Canada. In 1535 it was taken in the name of the king of France by Jacques Cartier, and during the next two centuries was French. In 1763 it passed by conquest to Britain, and in 1791 was made a separate province. The rebellion in Quebec, 1837-38, led to the union of Upper and Lower Canada in 1841, a union which broadened into the federation of 1867. *See Canada.*

Quebec. City of Canada and capital of the prov. of that name. It stands on the N. bank of the St. Lawrence just where it is joined by the St. Charles, being built in the angle formed by the two. It is 180 m. from Montreal. The position is a magnificent one, being on the top of bold cliffs with the river, which is here over a mile wide, at their base. The headland is known as Cape Diamond. It is served by the C.P.R. and the Canadian National lines.

Quebec consists of an old and a new town, or lower and upper, steps leading from one to the other. The lower town is the older one, and the business centre. The old city crowns the summit of the cliff, but includes a few narrow picturesque streets at its base; the large modern manufacturing district is on the flat banks of the St. Charles. Walls, built in the 19th century, stand on the site of the original fortifications, and the citadel with its glacis and massive walls dominates the city. Outside

Quebec arms

Quebec. Plan of the city showing principal docks and wharves

Quebec. Map of the Canadian province formerly known as Lower Canada

the walls, overlooking the St. Lawrence, are the Plains of Abraham.

The most important churches are the R.C. cathedral, built in the 17th century and enlarged later; Notre Dame des Victoires, built to celebrate the repulse of the English fleet in 1690 and 1711; the Anglican cathedral, and S. Matthew's. Laval university is a large building, including a library and a picture gallery. The city's finest promenade is Dufferin Terrace overlooking the St. Lawrence; here, where the Château St. Louis, the headquarters of the French government, stood until burnt down in 1834, is a statue of Cham-

plain. The Hôtel Dieu, founded in 1639, is a hospital, and there are other remains of the French occupation, including the Ursuline convent. The buildings of the Quebec legislature form a fine block standing in large grounds.

Quebec's chief industry was shipping, but much of its trade has passed to Montreal. It has, however, a fine harbour, protected by the Isle of Orleans, and extensive docks. Timber is a staple industry, and here are sawmills and furniture factories. The manufactures include machinery, boots and shoes, leather goods, etc.

Quebec was founded in 1608 by

Champlain, its name, an Indian one, referring to the narrowing of the river here. Earlier it was an Indian settlement. From 1629 to 1632 it was in possession of the English, and in 1663 was made the capital of New France, being for long the largest city of Canada, the military headquarters, the centre of social life, and the ecclesiastical metropolis. In 1759 it was taken by the British, and in 1763 was ceded to Great Britain, and remained the capital of Canada until 1841. There was a great celebration in honour of its tercentenary in 1908. Pop. est. 165,000. See Abraham, Plains of; Bridge illus., p. 1424; consult Old Architecture of Q., R. Traquair, 1947.

Quebec, CAPTURE OF. British success during the Seven Years' War. In 1711 the British in N. America equipped a force of 5,000 men to drive the French from Quebec, but the fleet which carried them was damaged by a storm.

In 1759, under Wolfe, 9,000 men were sent with a fleet up the St. Lawrence. On June 26 they cast anchor off the Isle of Orleans, and the French defenders offered little opposition to the establishment of their camp along the Montmorenci. For some months, however, Wolfe did nothing effective.

On Sept. 3 the troops were first moved to the other (S.) side of the St. Lawrence. On the 12th an attack was feigned below the city, while secretly Wolfe with 4,000 men went up the river in boats. In the night they were taken quietly

to the spot, about 1½ m. above the city, selected for a landing, and in the early morning of the 13th they disembarked and ascended a narrow path to the heights above the river. The French were soon in battle order, and the engagement took place on the Plains of Abraham. The British fire soon broke the French line and the latter fled into the city, the British following until stopped by the guns of the garrison. Both leaders, Wolfe and Montcalm, were killed. The British remained in possession, and on Sept. 17 Quebec surrendered. See Abraham, Plains of; Wolfe.

Quebec Act. Measure passed into law in 1774, which dealt with the government of the province of Quebec, annexed by Great Britain eleven years before. The Act extended the area of the province, taking in a large tract of land N. of the St. Lawrence, previously part of Newfoundland. Roman Catholics were confirmed in the freedom of worship they had enjoyed under the rule of France, and their priests were allowed to collect tithes from the faithful. French law was to prevail in civil and English law in criminal cases. The government was entrusted to a nominated council, and the parliament in London retained the right of taxation.

Quebec Bridge. Bridge crossing the St. Lawrence river at Quebec. At the time of its erection it was the longest clear-span bridge in the world, its central span between supports exceeding the main spans of the Forth Bridge by 90 ft. The bridge is of the cantilever type, with a main river span of 1,800 ft. clear opening, which includes a girder span 640 ft. long supported on the ends of the cantilever arms, of which there are four. The total length is 3,240 ft., and the clear height from water-level to the underside of the central span is 150 ft. It carries two rly. tracks and a foot-walk. It was opened to traffic in 1917.

The erection of the first bridge proceeded until one of the cantilever arms and a portion of the central girder span were completed, when, on Aug. 29, 1907, nearly half the bridge, weighing some 15,000 tons, collapsed into the river, with a loss of about eighty lives. In 1910 a contract for a new bridge of improved design was made, and work proceeded until Sept., 1916, when, in the act of hoisting the central span into position, the latter, measuring 640 ft. long and weighing 5,500 tons, collapsed, leaving the

cantilever arms intact. See Bridge illus. p. 1424.

Quebec Conference. Name given to two conferences held at Quebec during the Second Great War. The first, Aug. 17-25, 1943, was attended by Winston Churchill, prime minister of the U.K., F. D. Roosevelt, U.S. president, and T. V. Soong, Chinese foreign minister. It decided, among other things, that there should be a diversionary landing in S. France to coincide with the main Allied landings in Normandy (the S. France landing was in fact made two months later); drew up strategic plans for the advance in the Pacific against Japan; and set up S.-E. Asia command, under Lord Louis Mountbatten as supreme Allied commander in S.E. Asia. At the second, Sept. 11-16, 1944, attended by Churchill, Roosevelt, and the combined chiefs of staff, plans were drawn up for Allied strategy in the Pacific and in Europe during the ensuing months; one important decision was to cut out three intended Pacific operations and go straight to Leyte in the Philippines. Stalin was invited to attend the 1944 conference, but excused himself on the ground that with the Russian offensive developing on an increasingly broad front, he could not leave the direction of the army. Churchill went to Moscow, Oct. 9-18, to inform him of the decisions reached.

Quebracho (*Aspidosperma quebracho*). Tree of the family Apocynaceae, native of S. America.

Quebracho. Leaves and flowers of this S. American tree. Inset, single flower

Its bark yields the drug known as white quebracho, which has been administered in cases of dyspepsia, phthisis, and bronchitis.

Quedlinburg. Old German town in the Land of Saxony-Anhalt. It stands on the river Bode, near the Harz mountains. Built in 936 by Otto the Great as a convent for the daughters of emperors, and

a sovereign principality, Quedlinburg developed into one of the principal seats of learning of medieval Germany. Its surviving buildings recall this period: a huge cathedral, 1070-1129 (crypt, 936, with royal tombs); a town hall of 1310; S. Nicholas, a 13th century church; S. Benedict, 13th-15th century. In 1485 the Saxon dynasty acquired the protectorate over the abbey, which in 1540 was converted to Protestantism and in 1698 sold to Brandenburg. Modern Quedlinburg gained a reputation for nurseries and seed production; it had also engineering works and dye factories. Little damaged in the Second Great War, it lay in the Russian zone of occupation after it, and received many refugees. Pop. (1950) 35,850.

Queen (A.S. *cwēn*). Term applied to a woman ruler. A queen regnant rules in her own right; a queen consort is the wife of a ruling king; a queen dowager is the widow of a deceased king. While some countries bar a female from succession to sovereignty, e.g. by the Salic Law (*q.v.*), others take a queen only in default of heirs male. In the British Empire a woman succeeds her father on the throne when she has no brothers, and thus Princess Elizabeth is heiress presumptive to King George VI. Besides being used for a piece in chess (*v.i.*) and a picture card in a pack of cards, the term queen is found by extension in the animal kingdom, e.g. queen bee, queen wasp, to denote a creature of special function. A female cat is also called a queen.

Queen. The most powerful piece on either side in a game of chess. It can move any number of squares in a straight line vertically, horizontally, or diagonally, so long as no piece of its own colour blocks the way, and may capture an enemy piece that does. Its present powers date from about 1480. See Chess illus. p. 1996.

Queen. One of the picture cards in each suit of a pack of playing cards. In all standard games it ranks immediately below the king, though in the true Spanish pack there are no queens. In the old French pack the queen of hearts was called Judith (probably after a daughter-in-law of Charlemagne); diamonds, Rachel; clubs, Argine (perhaps an anagram of Lat. *regina*, queen); spades Pallas, or Minerva. The queen of spades is commonly regarded as unlucky and in games of the Black Lady class is a penalty card; though in bézique it is specially valuable.

Queen, THE. London journal for women. Its full title is The Queen, the Lady's Newspaper, and Court Chronicle. Founded as a weekly by S. O. Beeton, Sept. 7, 1861, The Queen, an Illustrated Journal and Review, was acquired in 1862 by Mr. Serjeant Cox, who, in 1863, bought the Lady's Newspaper, which had existed since 1847, and amalgamated the two publications. Another amalgamation was with The Court Chronicle, while the Bazaar, Exchange, and Mart first appeared as a Queen supplement. The Queen was acquired in 1919 by the proprietors of Land and Water, and issued by The Field Press, Ltd. On Dec. 31, 1937, it passed into the ownership of Hector Caird. During the Second Great War it became a fortnightly.

Queen Alexandra's Royal Army Nursing Corps. British nursing organization, known until 1949 as Queen Alexandra's Imperial Military Nursing Service. This was founded in 1902, from the organization previously known as the Army Nursing Service. Appointments are given to unmarried women duly qualified under War office regulations. In 1918 the two advisory boards which hitherto dealt with the Q.A.I.M.N.S. and the Territorial Force Nursing Service were reconstituted as a joint board under the title of Queen Alexandra's Army Nursing Board, with the director-general, A.M.S., as chairman. There was a Queen Alexandra's Imperial Military Nursing Service Reserve in the First and Second Great Wars. See Nursing.

Queen Anne. Style of architecture existing in England during the reign of Anne (1702-14). In fact, this period witnessed no special developments in architecture, and the fashionable style throughout it was according to the classic ideals of Early Georgian. But in the indigenous architecture of England there lingered many traces of the picturesque Elizabethan manner, half classic and half medieval; and the architects of the later 19th century, who reintroduced the old chimneys, dormers, and gables into domestic dwellings, found it convenient to label their efforts as "Queen Anne." Attractive results were obtained by Norman Shaw (*q.v.*),

and others working along the same lines, in England. The attempt to introduce this fashion into the U.S.A., with different and inappropriate materials, was hardly a success. Of genuine Queen Anne buildings, Blenheim Palace, designed by Vanbrugh (*q.v.*), is one of the few examples of first-class importance. (See Architecture).

In furniture, the age of Queen Anne was marked by a tendency towards comfort and home-

Queen Anne. Three examples of Queen Anne style furniture. A card-table in oak veneered with walnut. Top, a walnut bureau cabinet. Bottom, a walnut chair

Centre photo by courtesy of the Director, Victoria and Albert Museum, London

liness, differing from the ornateness of previous periods, and altogether apart from the important movement in France. Dutch marquetry work, sometimes imitated by English furniture makers, was the only foreign element in this strongly English style. Walnut was the principal wood, but larger pieces such as the settee were in oak, as in Jacobean times. Characteristics of Queen Anne tables and chairs were the cabriole and colt's-foot legs.

Chairs, though sometimes made with solid backs, more often show the open type of back, with a fiddle or urn shaped splat. Claw-and-ball feet were common. The seat was generally loose and stuffed. Cabinets, chests of drawers, "grand-

father" clocks, were ornamented with marquetry. Veneering also came into practice during this period, and some graceful effects were obtained thereby. The cabinet or chest of drawers on a stand with horned legs, veneered in walnut, is typical of the period. The modern bureau, with bookcase above and sloping front covering drawers and recesses, dates from this time. Black and gold lac decoration was introduced from the East, through Hol-

land. Consult Veneered Walnut Furniture, 1660-1780, R. W. Symonds, 1947.

Queen Anne's Bounty. Fund originally derived from the first-fruits and tenths of certain clerical incomes, formerly part of the crown revenue and transferred in 1704 by Queen Anne to the Church of England. First-fruits and tenths were almost entirely abolished in 1926. It then dealt with collection and distribution of dilapidation charges, sale and purchase of parsonage houses and glebe. On March 31, 1948, it united with the Ecclesiastical Commissioners under the new title of Church Commissioners of England.

Queen Bee. Type of radio-controlled, pilotless aeroplane developed at the Royal Aircraft Establishment, Farnborough, in 1935, as an A.A. target. The first was a Tiger Moth with a radio receiver tuned in to a ground transmitter. Ground signals passed through the receiver to relays and operated the aircraft's rudder, elevators, and engine-throttle. Queen Bees were used during and after the Second Great War to train army and naval A.A. gunners.

Queenborough. Mun. borough and seaport of Kent, England. On the Isle of Sheppey, it stands at the junction of the Swale and the Medway, 2 m. by rly. S. of Sheerness. Formerly there was a daily service to Flushing. Glass, pottery, and fertilisers are manufactured. Queenborough is named after Philippa, wife of Edward III,

Queenborough arms

as that king built a castle here to protect the crossing of the Swale. It was made a borough about the same time, and from 1572 to 1832 sent two members to the house of commons. It was a centre of the wool industry and has oyster fisheries. Pop. 3,000.

Queen Charlotte Islands. Insular group off British Columbia, Canada. The islands lie 130 m. N.W. of Vancouver in the Pacific Ocean. Graham Island, the largest, is for the most part low and level, though Mount Needham, in the S., reaches 4,000 ft. The smaller islands are mountainous, reaching over 5,000 ft. Forests abound, and there are some minerals. They are sparsely populated, and Keddah Bay, Queen Charlotte City, and Skidegate are the chief settlements.

Queen Charlotte's Hospital. Maternity hospital, founded in 1739 in Marylebone, London. In 1940 it was removed to a 6-acre site at Goldhawk Road, Hammer-smith, the new buildings costing over £500,000 and taking several years to build. Building continued during and after the Second Great War. It is a famous training school for midwives, and in 1948 was combined, as a post-graduate teaching hospital, with the Chelsea Hospital for women, under the title of Queen Charlotte's and Chelsea Hospitals. It was then to work in conjunction with the new institute of obstetrics and gynaecology.

Queen Charlotte Sound. Channel of the Pacific coast of Canada. It separates the N.E. of Vancouver Island from the mainland of British Columbia, and is connected with the Strait of Georgia to the S. by narrow channels which do not exceed half a mile in width at Seymour Narrows.

Queen Elizabeth. Former British battleship and nameship

powered by geared turbines developing 80,000 s.h.p. to give her a maximum speed of 24 knots. Her armament contained battery of eight 15-in. guns; she was the first British battleship to mount guns of this calibre and the first to be entirely oil-fired. She carried a complement of 1,100 men.

In the First Great War she was Admiral de Robeck's flagship at the Dardanelles, and in 1917 flagship of the Grand Fleet. She was not in the battle of Jutland as she was in dry dock, but it was on board her that Beatty arranged and received the surrender of the German fleet in 1918. The Queen Elizabeth served in the Mediterranean in the early part of the Second Great War. While at anchor in Alexandria, Dec., 1941, she was sunk by Italian "frogmen" who attached limpet mines to her hull. Raised and patched, she was repaired in New York, becoming flagship of Admiral Cunningham's Mediterranean fleet. In 1945 she was flagship of the East Indies fleet and served off Burma. She was scrapped in 1948.

Queen Elizabeth. British liner. Laid down at Clydebank on Dec. 4, 1936, for the Cunard-White Star Line, she was launched by Queen Elizabeth on Sept. 27, 1938. Displacing 85,000 tons on a length of 1,031 ft. and a beam of 118 ft., she is powered by geared steam turbines developing 158,000 h.p. and driving four propellers to give a service speed of 29 knots. She can accommodate 850 first-class, 720 cabin-class, and 745 tourist-class passengers, arranged on 14 decks, and carries a crew of 1,100. In the fitting-out basin at Clydebank when the Second Great War started, she was hurriedly made seaworthy, and on Feb. 26, 1940, sailed for New York, where

service with the Queen Mary (*q.v.*), bringing U.S. troops to Great Britain and accommodating 15,000 men on each passage. She never sailed in convoy, but relied for protection on her high speed and armament of 32 guns. After VE-day, the Queen Elizabeth repatriated U.S. and Canadian troops until March, 1946. She sailed from Southampton for New York on her first civilian passenger voyage on Oct. 17, 1946. On July 30, 1947, she set up a new (unofficial) Atlantic record by making passage from Bishop's Rock to Ambrose Light in 3 days 5 hours and 50 minutes, beating the official record by nearly 15 hours.

Queenhithe (Mid. Eng. *hithe*, haven). London street and dock, lying S. of Upper Thames Street. Early in the 10th century it belonged to a Saxon, Ethedred. In the time of Stephen the property of the priory of Holy Trinity, Aldgate, subject to certain grants to S. Katharine's hospital and other charities, it became the chief water gate of the city; tolls levied on corn, etc., lander here formed part of the revenue of queens consort. Henry III confirmed its gift by Richard, earl of Cornwall, to the city in exchange for a rent of £50 per annum. Queenhithe, known as Cornhithe in the 12th century, was the site of London's first fish market. The 12th century church of S. Michael, known as S. Michael-de-Cornhithe and S. Michael ad Ripam, was restored in 1624, burnt 1666, rebuilt by Wren, 1670-83, and demolished in 1876, when the parish was united with that of S. James, Garlickhithe. The gilded vane on the rectory, representing a grainship, was taken from the old church. Queenhithe gives its name to one of the city wards.

Queen Mab. Philosophical poem by Shelley. It was first published in 1813; parts of the poet altered and revised in 1816 as *The Daemon of the World*. Written when the poet was 18, it shows all his early command of poetic language and rhythm in its part regular, part irregular, blank verse, and expresses the views of a youthful rebel against accepted religious beliefs. *See Mab.*

Queen Mary. British liner. Laid down at Clydebank in April, 1931, as No. 534, her construction was suspended at the end of the year owing to economic depression, and was not resumed until 1934. She was launched by Queen Mary on Sept. 26, 1934, and made her maiden voyage to New York on

Queen Elizabeth. The 85,000-ton Cunard-White Star liner which was launched in Sept., 1938, and set up an unofficial Atlantic speed record in 1947

of a class which included the *Barham*, *Malaya*, *Warspite*, and *Valiant*. Built at Portsmouth Dockyard, she was commissioned in Dec., 1914. Displacing 35,000 tons fully laden on a length of 643 ft. and a beam of 104 ft., she was

she was converted into a troopship. She began troopship in April, 1941, and during her war service carried 811,324 men and steamed 492,635 m. to Allied ports all over the world. In 1943 she operated an Atlantic shuttle

May 27, 1936. Displacing 81,235 tons on a length of 1,019 ft. and a beam of 118 ft., she is powered by geared steam turbines developing 158,000 h.p. and driving four propellers to give a service speed of 29 knots. She can accommodate 2,000 passengers and has a crew of 1,050. In 1936 she made a record Atlantic crossing by

provides training in medicine, in conjunction with the London hospital. There is a faculty of arts.

Queen Mary Land. Coastal tract of Antarctica. It lies E. of Kaiser Wilhelm II Land (*q.v.*), in lat. about 96°–100° E., and is bounded by Davis Sea and Shackleton Shelf, and holds Denman and Northcliffe glaciers. Its

4th duke, who has a separate entry, died in 1810, when the titles were separated. The dukedom and estates passed to the 3rd duke of Buccleuch; they included Drumlanrig Castle, Dumfriesshire. The marquessate passed to Sir Charles Douglas (1777–1837), who became the 5th holder, and from him the titles passed to his son and other descendants. The 8th marquess, John (1844–93), was the sportsman who drew up in 1867 the boxing rules called by his name. He was the father of Lord Alfred Douglas (*q.v.*). In 1920 Francis (b. 1896) became the 10th marquess. The peer's eldest son is known as Viscount Drumlanrig. *See* Boxing.

Queensberry, JAMES DOUGLAS, 2ND DUKE OF (1662–1711). Scottish politician. He was born Dec.

2nd Duke of Queensberry

18, 1662, and became a privy councillor of Scotland, 1684, but joined the army of the prince of Orange on Nov. 30, 1688. He succeeded his father as duke of Queensberry, March 28, 1695, and in 1700 was appointed high commissioner of the Scottish parliament. In 1702 he became secretary of state. Prominent in bringing about the union of the parliaments in 1707, Queensberry was rewarded with the Garter. Subsequently a commissioner to the first parliament of Anne, he acquired the name of the Union Duke, and he closed the last Scottish parliament, Jan. 6, 1707. His reception in England after this event was a "progress of triumph." A pension of £3,000 was granted and in 1708 he was created duke of Dover, marquess of Beverley, and Baron Ripon. He was also made a secretary of state, and died July 6, 1711.

Queensberry, WILLIAM DOUGLAS, 4TH DUKE OF (1724–1810). Born Dec. 16, 1724, he succeeded his father as earl of March in 1731. Unsuccessful in his claim to the peerage of Cassilis (1759), he was a representative peer for Scotland from 1761 to 1784, and became duke of Queensberry, Oct. 22, 1778. Under the title of

4th Duke of Queensberry

Queen Mary. This 81,000 ton Cunard-White Star liner, launched in Sept., 1934, broke the record for the Atlantic crossing on four occasions
By courtesy of Cunard-White Star, Ltd.

steaming from Bishop's Rock to Ambrose Light (2,907 m.) in 4 days and 27 min., and a few weeks later reduced that time by 30 minutes. The French liner Normandie regained the record in 1937, but in 1938 lost it again to the Queen Mary, which covered the course in 3 days 21 hours and 45 min., two voyages later reducing this time to 3 days 20 hrs. 42 mins.

In New York in Sept., 1939, the Queen Mary was moved to Sydney in March, 1940, and converted into a troopship, visiting Australia and S. Africa, and on her first voyage from New York to Cape Town reducing the previous record of 19 days to 12. Altogether she travelled over 1,000,000 miles and carried nearly 3,000,000 men. In Oct., 1942, she collided in the Atlantic with the anti-aircraft cruiser Curaçoa, the latter being sunk with heavy loss of life. After the war in Europe the Queen Mary was used for repatriating U.S. forces and taking British wives of U.S. soldiers to America. Derequisitioned early in 1947, she left Southampton, July 31, 1947, on her first post-war civilian passenger voyage.

Queen Mary College. Educational institution in Mile End Road, London, E.I. Originally founded as a technical school in connexion with the People's Palace (*q.v.*), with money grants made by the Drapers' Company, it became a recognized school of London university in 1907, then being called the East London College. In 1934 Queen Mary presented it with a royal charter and it was then incorporated as Queen Mary College. With over 800 students it specialises in science and engineering, and also

coast line touches the Antarctic Circle. It was explored by the Mawson Australasian expedition of 1911–14.

Queen's, AND QUEEN'S OWN. Prefix given to a number of regiments in the British army. The Queen's is the popular designation of the Royal West Surrey regiment (*see* West Surrey Regt.), and the 16/5th Lancers. Queen's Own is a designation used in the titles of the 4th and 7th Hussars and the Cameron Highlanders. The 9th Lancers is officially the 9th (Queen's Royal) Lancers. *See* Hussars; Lancers.

Queens. Borough of New York City, U.S.A. It is situated on Long Island, and includes Long Island City, Jamaica, Newtown, part of Hempstead, and several islands in Jamaica Bay. Much of the borough is land that has been reclaimed or filled in from waste. Queens was made a borough in 1898. Area, 103 sq. m. Pop. 1,297,634. *See* New York.

Queensberry, MARQUESS OF. Scottish title held by the family of Douglas since 1682. In 1633 Sir William Douglas, lord of Drumlanrig, was created earl of Queensberry; he had been a baron and a viscount since 1628. His grandson, William (1637–95), 3rd earl, was made a marquess in 1682 and a duke next year. His son James was made duke of Dover and marquess of Beverley in 1708. These titles passed by special remainder to his second son, Charles, the eldest being an imbecile. On his death in 1778, the English titles became extinct, but the Scottish ones and the estates passed to William Douglas, earl of March, a descendant of the 1st duke. This strange being, the

Queen's College, Oxford. Front quadrangle with entrance from the High Street

Baron Douglas of Amesbury he was created a peer of Great Britain in 1786. In politics he figured only as a supporter of the prince of Wales in opposition to George III's ministers, and subsequently became contemptuously known to the town as "Old Q." and, living at No. 138 in that thoroughfare, as the "Star of Piccadilly." McCarthy, writing of the rowdies of that period, distinguishes Queensberry as the "worst and basest spirit of the gang." He died Dec. 23, 1810. *See* Piccadilly.

Queensbury. Locality in the W. Riding of Yorkshire, England. Part of the urb. dist. of Queensbury and Shelf, it lies 4 m. N. of Halifax, 5 m. S.W. of Bradford, and has a rly. station. Pop. 5,763. Another Queensbury, a dist. of the bor. of Wembley, Middlesex, has a station on the Bakerloo line.

Queen's Channel. Indentation on the coast of Northern Territory, Australia. It is in the S.W. corner of Arnhem Land, and receives the Victoria river.

Queen's Club. London athletic club. Founded in 1886, it is at West Kensington, London, W. Its objects are to provide various games for members, who have courts for tennis, lawn tennis, squash, and fives, also a club house. Formerly there were a football ground and running track.

Queen's College. College of Oxford University. It was founded in 1340 by Robert de Eglesfield, who was sometime chaplain to

Queen's College, Oxford, arms

Philip, queen of Edward III. Its visitor is the archbishop of York, and from its opening it has had a special connexion with the north of England, some

every Christmas Day at dinner a boar's head is carried into the hall and an old carol is sung. The college owns much valuable land in Southampton. Henry V (as prince), Wycherley, Addison, Collins, Bentham, and Pater were up at Queen's. *See* Oxford.

Queens' College. College of Cambridge University. Founded 1448 by Margaret of Anjou, wife of

Queens' College, Cambridge, arms

Henry VI, with the assistance of Andrew Docket, rector of S. Botolph's and principal of S. Bernard's hostel, it was described as "The Queenes collage of sainte Margarete and sainte Bernard." Refounded in 1465 by Elizabeth Woodville, wife of Edward IV, and provided by statutes of 1475 with a president and 12 fellows, Queens' retains much of its early architectural character. The E. front was restored in 1875 and the hall in 1875 and 1909. The existing chapel dates from 1891, its predecessor now serving as a lecture-room and library annexe. New buildings were erected on the W. of the river in 1935. Famous men associated with the college are S. John of Rochester (Bishop Fisher); Whitgift; Fuller, the antiquary; and pre-eminently Erasmus, after whom a tower and court are named.

Queen's College. London college for the higher education of women. It was established in Harley Street in 1848, by F. D. Maurice and other professors of

all scholarships were given to boys from these counties. Its head is the provost. The buildings face the High Street; in the classical style, they have been attributed to Wren and Hawksmoor, and the most interesting part is the library, which contains some rare books. At Queen's

King's College, with the aid of the Governesses' Benevolent Institution, and was incorporated by royal

Queen's College, London. The facade of this Harley St. college for women

charter in 1853. The college is self-supporting, and the course extends over four years. *See* Beale, D.; Maurice, F. D.

Queen's County. Former name of an inland co. of Eire, since 1922 known as Leix or Laoighis (*q.v.*).

Queensferry, NORTH. Village of Fife, Scotland. It stands on a peninsula on the N. side of the Firth of Forth, opposite S. Queensferry. With a rly. station it is visited in summer for bathing. It is the terminus of a half-hourly ferry service by diesel electric boats. Pop. 1,300.

Queensferry, SOUTH. Royal and mun. burgh and seaport of West Lothian, Scotland. It stands on the Firth of Forth, at the S. end of the Forth Bridge (*q.v.*), 9 m. W. by N. of Edinburgh, and has a rly. station. The principal industry is connected with the preparation of oil. Near Rosyth, it was a naval centre during the First Great War. Buildings include the Norman church of Dalmeny, the town or public hall, and

Queens' College, Cambridge. College buildings seen from the banks of the Cam

North Queensferry, Fife, Scotland. The village overshadowed by the N. span of the Forth Bridge

a memorial hall built by Lord Rosebery in memory of his wife. Queensferry was made a burgh in 1363. Pop. approx. 1,800. Near are Dalmeny and Hopetoun House, seats of the earl of Rosebery and the marquess of Linlithgow; also Barnbogle and Dundas Castles. The name Queensferry is due to the fact that from here Margaret, wife of Malcolm Canmore, frequently crossed the Forth when travelling between Edinburgh and Dumbarton. It is mentioned in Scott's *Antiquary* and Stevenson's *Kidnapped*, the former immortalising the Hawes Inn.

Queen's Hall. Former London concert hall, in Langham Place, W.1. Designed by T. E. Knightley, it was built in 1893, and consisted of two halls, the larger accommodating 2,492, and the smaller being at first used for recitals and exhibitions. It had 17 exits into three streets, the grand circle being on street level. The organ was built by Hill. The hall was opened Dec. 2, 1893, with a choral and orchestral concert conducted by Cowen. In 1895 was formed the Queen's Hall orchestra, with Robert Newman as manager and Henry Wood as conductor, and promenade concerts (*g.v.*) were inaugurated. After the closing of S. James's Hall in 1905, Queen's Hall was London's chief musical centre until it was destroyed in the German air raid of May 10, 1941. Consult Queen's Hall, R. Elkin, 1944.

Queensland. State of the Australian Commonwealth, the largest and most northerly of the three eastern states. The area of the state is 669,833 sq. m., of which 360,000 sq. m. are within the tropics. Off the N.E. coast is the Great Barrier Reef which consists of a formation 1,250 m. long of innumerable coral reefs, isles, and shoals enclosing an area of 80,000 sq. m. The many rivers fall into three groups. The Fitz-

roy, Burdekin, and Brisbane flow to the E. coast; the Flinders, the largest river in the state, and Mitchell flow into the gulf of Carpentaria; Cooper's Creek and other streams drain S.W. to the area of internal drainage in the heart of the continent. The Great Dividing or Main Range is continued N. from New South Wales at a lower elevation. The highest

Queensland arms

peak in Queensland is Mt. Bartle Frere, 5,438 ft.

Most of Queensland experiences two distinct seasons, a warm, wet summer and a dry, relatively cool winter. Mean temps. vary from about 80° to 90° F.; at Cairns in the N.E. the rainfall exceeds 180 ins. annually. Hurricanes frequently occur along the coast during the hot months, reaching a maximum in late summer. The S.W. is arid, semi-desert scrubland, the W. slopes are grassland or savanna where eucalypts alternate with scrub, the E. slopes are forested mainly with eucalypts, and the coasts are heavily forested with typical mangrove swamps along the shore. Much of the W. falls within the area where underground water is tapped by artesian bores; there were 2,047 bores in 1945, and water was flowing from 1,358 of them.

Sheep rearing is an important industry, over 23,000,000 sheep being pastured in the great natural grasslands of the interior, or on the Darling Downs. Wool accounts for more than half the value of overseas exports. Cattle are the main livestock: there are a million and a half dairy cattle

Queensland. Map of this half-tropical state of the Australian Commonwealth

and over 5,000,000 beef cattle. They thrive on all the coast lands.

Queensland is the only country to produce cane-sugar with white labour only. Production in 1945 was more than 650,000 tons. Less than seven tons of cane were needed to manufacture a ton of raw sugar—a world record. Other main crops are wheat, maize, fruits, cotton, potatoes, and tobacco. Queensland forests yield very fine woods, as well as much utilitarian pine and hardwood. Gold and tin are mined in considerable quantities, and copper, manganese, and iron ores obtained. Coal mined at Ipswich and other centres is used chiefly as bunker coal on the coasting steamers. Thursday Island is a centre for the pearl and bêche-de-mer fishery. Manufactures are confined almost entirely to the production of food-stuffs and articles of clothing, mostly for local use. More than 6,500 m. of rly., nearly all state-owned, connect the chief centres of Normanton, Cooktown, Cairns, Townsville, Mackay, Rockhampton, Maryborough, and Brisbane. Main roads in 1945 were 17,183 m. in extent, of which two roads each some 400 m. long were built for defence purposes in 1942. One connected Mt. Isa in central Queensland with the Stuart Highway (g.v.) at Tennant Creek; the other ran about 80 m. inland from Duaringa via Clermont to Charters Towers. Until 1938 small local authorities were responsible for the generation of electricity, now the concern of the state, which owned 47 stations in 1945. In that year nearly 70,000 acres were made cultivable by irrigation. In May 1948, cultivation of 300,000 acres in mid-western Queensland for coarse grains and sunflowers was started by the Queensland British Food Corp'n.

Administration and Education

The seat of the government is Brisbane. The governor is the representative of the king. The state parliament has only one house—the legislative assembly of 62 members elected every three years on an adult male and female franchise based on a short residence qualification. There is a prime minister, who is vice-president of the executive council consisting of himself and nine other ministers; 16 members are sent to the federal house of representatives and 10 to the senate.

Primary education is free, secular, and compulsory up to the age of 14. Secondary education, which is also free, depends upon

examination tests. There are also a certain number of free places at Queensland university in Brisbane which was founded in 1911. Tuition by correspondence is well organized.

In 1945 the population was 1,085,681. There are in addition about 19,000 aborigines maintained on government or mission settlements and stations.

Although Torres, Cook, and Flinders visited the coasts, the country was virtually rediscovered by Oxley in 1823. Immigration began by the spreading out over the Darling Downs and beyond of squatters seeking pasture for their sheep. By 1859, when the colony was separated from New South Wales, the pop. numbered 25,000, and a rapid increase in numbers followed the gold discoveries, 1866–79. *See* Aborigines; Australia; *consult also* Queensland Politics during Sixty Years, C. A. Bernays, 1919; Then and Now, F. Alexander, 1935; Flying Fox and Shifting Sand, F. Ratcliffe, 1938; Undiscovered Australia, G. H. Wilkins, 1938.

Queensland, UNIVERSITY OF. Seat of higher education, situated at Brisbane, Queensland, Australia. It was established in 1909. The buildings include the library with 84,000 vols., and the central technical college, in addition to classrooms, laboratories, etc. In connexion with the university are residential colleges belonging to religious denominations, and one for women. The senate is the governing and managing body. Of its 20 members, 10 are appointed by the governor in council, 10 are elected by the council of the university. The faculties are: arts, science, engineering, commerce, agriculture, law, dentistry, veterinary science, and medicine. Correspondence courses are available for those who live remote from the university. There is an annual state grant of £40,000 as well as an income of £8,000 from a bequest of £200,000 made by Sir Samuel McCaughey.

Queen's Messengers. Civil defence organization in the U.K. founded during the Second Great War. Brought into being as a result of the air raids in 1940, they were convoys sent by the ministry of Food to carry food and comforts to badly bombed towns. A unit consisted of a water tanker holding 300 gallons; two food lorries with soup boilers, fuel, and utensils; and three mobile canteens. Five motor cyclists completed the con-

voy. Of the fleet of 18 Queen's Messengers ready for duty in 1941, the first was the gift of Queen Elizabeth, and the remainder were presented by the American war relief organization.

Queen's Park. A suburb of Glasgow, Scotland. Noted for its football club (the leading amateur club of Scotland, not to be confused with Queen's Park Rangers, a London club, in 1948 promoted to the Second Division of the football league), it contains a recreation ground and a museum. *See* Glasgow.

Queenstown. Town of Tasmania, Australia. It stands on the Queen river in Montagu co., 23 m. N.E. of Strahan, its port. The terminus of the Mt. Lyell Company's rly., it contains reduction works for copper mined at Mt. Lyell, saw-mills, and brickworks. Pop. 3,800.

Queenstown. Town of the Cape Province, S. Africa. It stands on an elevated plateau, 3,500 ft. high, between the Stormberg and Katberg Mts. and near the Great Kei river. It is on the rly., 154 m. N.W. of East London. There is a botanic garden. The town is the centre of a district producing wheat and wool. Queenstown, founded in 1853 and named after Queen Victoria, is laid out in the form of a hexagon. Pop. (European) 8,136.

Queen's University, BELFAST. Northern Irish university. Founded in 1909, it was formerly Queen's College, which, established in 1849, was one of the three colleges in the royal university of Ireland. The latter was dissolved in 1909, when Queen's College itself was made a

Queen's University, Belfast, arms

university. It has eight faculties—arts, science, law, medicine, applied science and technology, agriculture, theology, and commerce—and admits women equally with men to its classes and degrees. The university is entirely non-residential, and affiliated to it is the municipal technical institute, an educational centre in Belfast. The university is governed by a senate of 44, four of whom are nominated by the crown, one being a woman; others are elected by Belfast and Londonderry corporations.

Queen's University. Canadian university at Kingston, Ontario. Founded in 1841 by members of the Presbyterian Church, it was at first mainly a theological centre.

In 1854 a faculty of medicine, and in 1893 a faculty of applied science, were added. In 1912 the faculty of theology, though still part of the university, was separated and became Queen's technical college under the United Church of Canada. The university itself is undenominational. Its buildings include a valuable library, museums, and laboratories. The degrees are open to men and women.

Queen's View. Rocky spur in Perthshire, Scotland. On the road between Pitlochry and Tummel Bridge, it overlooks Loch Tummel and gives a prospect of Schiehallion and the Shepherds of Etive. The name was given in compliment to Queen Victoria, who alighted here to admire the view.

Queensway. Official name of Mersey Tunnel (*q.v.*). It is also the name of the station which serves the street of Queensway, Bayswater, on the Central London line of the London underground rly.

Quelpart. Island belonging to Korea (Chosen). Situated at the S.W. entrance of the strait of Chosen, 53 m. S. of the S. extremity of Korea, it is a rock-bound island, encompassed by islets, and measures 45 m. in length and 21 m. in breadth. Its surface is hilly and well forested, Mt. Auckland, the culminating height, reaching to about 6,500 ft.

Quenching. Relatively rapid controlled cooling of a metal by artificial means after heat-treatment. Its object is to suppress undesired transformations or changes which might take place within the crystal structure of the metal, if allowed to cool slowly. Different speeds and ranges of cooling are required with different metals, to obtain the desired conditions. Quenching may be carried out by rapid immersion of the heated metal into a medium such as a molten metal or salt bath, an oil bath, a cold water bath, a chilled brine bath, or by holding it in a blast of cold air. Each method gives its own particular cooling rate and finishing temperature.

Quennell, PETER (b. 1905). British writer. The son of C. H. B. and Marjorie Quennell, joint authors of *A History of Everyday Things* in England, 1918-34, he was educated at Berkhamsted grammar school and Balliol College, Oxford, and contributed to *Life* and *Letters*, *The Criterion*, and other reviews. In 1930 he was appointed to the chair of English literature at Tokyo university. A novelist, early influenced by Proust, an essayist, and an art

critic, he wrote a vivid travel book, *A Superficial Journey*; *Aspects of 17th Century Verse*; studies of Byron; Caroline of England; Four Portraits (Boswell, Gibbon, Sterne, and Wilkes); and a life of Ruskin. He also translated de Gramont's memoirs, and edited Princess Lieven's letters to Metternich and Byron's letters and diaries. From 1944 he edited the *Cornhill Magazine*. See *Biography*.

Quentin Durward. Romance of France and Flanders in 1468, by Sir Walter Scott, the seventeenth of the Waverley novels, published in June, 1823. It was the first novel in which Scott ventured on foreign ground, and is one of the finest romances in the language. The titular hero is a young Scot who seeks his fortunes in France, becomes a member of the King's Scottish guard, champions the young and beautiful Isabelle de Croye, and by his good sense, firmness, and gallantry is put in possession of wealth, rank, and beauty. King Louis XI, Charles the Bold, duke of Burgundy, William de la Marck, Cardinal Balue, and Philippe de Comines are fine portraits, and the Bohemian scenes are noteworthy.

Quercus. Generic Latin name for the oak (*q.v.*).

Querétaro. Interior state of Mexico. Part of the plateau of Anahuac, it is situated between Hidalgo and Guanajuato, and covers an area of 4,432 sq. m. The N. part is mountainous, but elsewhere fertile valleys produce maize, fruit, sugar, and cotton. Mining is carried on. Pop. 244,737.

Querétaro. City of Mexico. Capital of the state of the same name, it stands on a plateau 6,170 ft. high, 110 m. N.W. of Mexico City on the National rly. Water is brought to the city by a Spanish aqueduct of 74 arches, 80 ft. high. The movement for independence began at Querétaro, and here, in 1867, the emperor Maximilian was shot. The Maximilian chapel was erected in 1901. Pop. 33,629.

Querfurt. Town of Germany. Situated on the Querne, a tributary of the Saale, on the branch rly. to Merseburg and 20 m. W. of that town, it possesses a Romanesque church and a castle dating from the 14th and 15th centuries. There are sugar refineries, cotton factories, breweries, and a horse market. Before 1635 Querfurt was the capital of a little independent state. In 1635 it became part of Saxony and in 1815 part of Prussia. After the Second Great War it came within the Russian zone of occupation.

Quern (A.S. *cweorn*, akin to corn). Primitive grain-mill, usually of stone. In Neolithic times—early

Quern, a primitive form of grain-mill

Egypt, Palestine (Deut. 24, v. 6), ancient Mexico (metate)—an oval grinder was rubbed upon a saddle-stone. Irish bullans and rock-basins mark the transition to the pair of disks, the nether with a vertical spindle engaging in a funnel-shaped hole through the upper, rotated by a wood handle. Querns were used to a large extent in Scotland down to the beginning of the 19th century.

Quesnay, FRANÇOIS (1694-1774). French economist. Born June 4, 1694, at Méré, in the dept. of Seine-et-Oise, the son of a small landed proprietor, he came to Paris and studied surgery and medicine, becoming court physician to Louis XV in 1752. He is best remembered for his writings on political economy. His *Tableaux Économiques*, published at Versailles, 1758, and rediscovered, 1890, made him the leader of the Physiocrats (*q.v.*). Adam Smith in *The Wealth of Nations* (Book iv, ch. 9) devotes considerable space to Quesnay's theory. Quesnay contributed articles to the *Encyclopédie*. His collected works were published by A. Oncken, 1888. He died Dec. 16, 1774. See *Political Economy*. *Pop. Kay-nay.*

Quesnel, PASQUIER (1634-1719). French theologian. Born in Paris, July 15, 1634, and educated at the Sorbonne, he entered the Congregation of the Oratory in 1657, and was ordained priest in 1659. The Jansenist tone of the first part of his *Réflexions morales sur le*

François Quesnay, French economist

Pasquier Quesnel, French theologian

Nouveau Testament, 1671, and the Gallicanism of his edition of the works of Leo the Great won for him the enmity of the Jesuits. Refusing, in 1684, to sign the anti-Jansenist formula, he had to flee to Brussels, where the first collected edition of the *Réflexions* appeared in 1687. Quesnel was imprisoned in 1703, but escaped to Amsterdam, where he resided until his death, Dec. 2, 1719. An English edition of the *Réflexions* appeared in 1719-25. *Pron.* Kaynel.

Quest. British exploration ship. Built in Norway, 1917, of oak, pine, and fir, she was specially con-

Quest. The British exploration ship, specially built for Arctic waters

structed for voyaging in Arctic waters, and was at first used as a sealer in the White Sea. She was 111 ft. long, 23 ft. in beam, and about 200 tons net burthen. Her sides were 2 ft. thick of solid oak, sheathed with steel. In 1921, after being altered and refitted, she was used to convey the Shackleton-Rowett Antarctic expedition party. Accommodation for the scientific staff and laboratories was built above and below decks. She returned to England on the abandonment of the expedition, 1922. *See* Antarctic.

Quetta. Capital of Baluchistan, Pakistan. At 5,500 ft. alt. among mts., it is a military outpost N.W. of, and guarding, the Bolan Pass, through which the strategic rly. from Quetta goes to the Indus valley. It is W. of the Harnai Pass, which also carries a strategic rly. From Quetta one rly. goes to Chaman on the Afghan frontier, overlooking the plains of Kandahar, and a second line goes to Nushki and then farther W. to the Persian frontier at Mirjawa. The town is a trade centre, but the winter cold drives away about a

quarter of the population. It had a staff college, the Camberley of the Indian army, until the transfer of power in 1947. Its growth dates from 1876, when the residency was established. A disastrous earthquake did heavy damage here in May-June, 1935, when 40,000 people were buried in the ruins of their homes. Pop. 64,476.

Quetta Pishin. Dist. of Baluchistan, Pakistan. It extends E. from the frontier of Afghanistan and is very mountainous, parts being as high as 11,700 ft. The rainfall varies from 6 to 10 ins. annually. It is crossed by the rly. from Quetta to Chaman through Pishin. The people are nearly all Pathans; there are a few Brahui in the S.W. Area, 5,310 sq. m. Pop. 156,289.

Quetzal or **QUEZAL** (*Pharomachrus mocinno*). Bird of the trogon family, inhabiting the central American uplands from Guatemala to Panama. Distinguished by resplendent plumage, its name is derived from an ancient Nahua word meaning green-feather. The cock bird, the size of a dove, is adorned with carmine breast-feathers and upper tail-coverts of metallic green, projecting one to three ft. beyond the tail.

The ancient Mexican chiefs forbade the killing of the birds, whose plumes were plucked and sent to them as tribute for their personal wear on head-dress and mantle. The plumes were preserved as heirlooms, and representations of them occur on Maya pottery, sculpture, and picture-writings. The bird, emblem of liberty, forms part of the national arms of modern Guatemala, and the quetzal is the unit of Guatemalan currency, equal to a U.S. dollar. *See* Birds colour plate.

Quetzalcoatl. One of the chief gods of ancient Mexican mythology, god of the air and of wisdom and teacher of the arts. His name signified serpent (coatl) clothed with green feathers (quetzal, *q.v.*). He was said to have ruled in Mexico in a time of peace and plenty, and when driven away by the sorceries of a rival he said that he would return; a legend which proved help-

Quetzalcoatl. Image of the Mexican god

ful to Cortés, who may well have seemed to a superstitious people the returning god. *See* Mexico.

Queue (Fr., tail). This term, first applied in France to an orderly line of people awaiting turns for bus or tram, has entered the English language, with the anglicised *pron.* kew, but is no longer connected specifically with transport. Queues for all purposes are common, their general voluntary acceptance marking acknowledgement of the fair principle of "First come, first served" rather than that of disorderly scramble. An earlier English use of the word, with the same *pron.*, applied it to the short pigtail worn, *e.g.*, by sailors.

Queuille, HENRI (b. 1884) French politician. *See* N.V.

Quevedo y Villegas, FRANCISCO GOMEZ DE (1580-1645), Spanish courtier and writer. Born at Madrid, he was educated at Alcalá university. He was attached to the court of the king of Spain, and later was secretary to the viceroy of Naples. In 1621 he returned to Spain, where he resided at the court, and amused himself and others by a constant succession of writings, many of them satirical. On a charge of having libelled the king he was imprisoned in 1639. Released in 1643, he died Sept. 8, 1645.

Quezaltenango. Dept. of S.W. Guatemala, Central America. It is bounded S. by the Pacific Ocean, is mountainous, and contains the active volcano Santa Maria, 12,355 ft. in height. The chief products are coffee, sugar, rubber, wheat, maize, and cattle. Population est., 120,000. Quezaltenango, the capital, lies 75 m. W.N.W. of the ruined capital, Guatemala la Nueva. It is built on a plateau at an alt. of 7,700 ft. The second largest town in the republic, it manufactures cotton, linen, and woollen goods, and trades in agricultural produce. Pop. 30,125.

Quezon, MANUEL LUIS (1878-1944). Philippine statesman. He was born on Aug. 19, 1878, at Baler, Luzon, and studied law at Manila university. He joined Aguinaldo (*q.v.*) during the insurrection that followed the Spanish-American war, 1898, and went to Washington, 1909, as a Philippine commissioner. He was elected president of the Philippine senate in 1916, remaining in office until his election as 1st president of the new commonwealth in 1935, and was re-elected in this post, 1941. When the Japanese invaded the Philippines he gave the fullest support to the U.S. Quezon left the

commonwealth after the fall of Manila and in May, 1942, established a provisional government in Washington. He sat on the Pacific war council. He died at Saranac Lake, N.Y., Aug. 1, 1944. His widow was killed by bandits, April 28, 1949, while journeying to open a hospital at Baler, Luzon.

Quia Emptores (Lat., whereas buyers). Opening words, used as the name of an English law passed in 1290. It was directed against the alienation by the lords of parts of their land and the consequent creation of fresh manors, a practice which tended to reduce the chances that such land would revert, owing to the failure of heirs or for other causes, to the king or other overlord. The law of 1290 provided that if a lord alienated some of his land, the new tenant would hold such land direct from the overlord, to whom it would return in case of escheat.

Quiberon. Town of France, in the dept. of Morbihan. It stands at the S. extremity of a peninsula which forms the W. land boundary of the Bay of Quiberon, 21 m. S.W. of Vannes. The peninsula is connected with the mainland by a seawall, and is defended by Fort Penthièvre. A rly. runs along the peninsula to the junction at Auray. At St. Pierre, on the E. coast, are menhirs and dolmens, and at the N.W., on the mainland, are the remarkable prehistoric monuments of Carnac (*q.v.*). There are two harbours, Port-Maria and Port-Haliguen, whence during summer steamer connexion is kept up with Belle-Île-en-Mer (*q.v.*), where Sarah Bernhardt transformed an old fort into a villa residence.

Quiberon is a convenient point from which to visit the gulf of Morbihan (*q.v.*), which is almost landlocked by the peninsulas of Rhuis and Locmariaquer, the channel between these being only half a mile wide. There are firm sands, and a small bathing establishment. On June 14, 1795, some thousands of French émigrés were landed by a British fleet at Carnac. They hoped to join the peasant revolt against the Convention. There were some veteran Chouan troops under Sombreuil, but the raw volunteers lacked discipline and adequate leadership. Much time was lost in disputes, and though the men fought gallantly at Quiberon and Fort Penthièvre, they were defeated by Hoche, a storm preventing the English vessels from rendering much aid. Sombreuil and about 900 survivors surrendered under the mistaken

impression that their lives would be spared. Sombreuil, the bishop of Dol, and 20 others were shot at Vannes; the rest in the Champ des Martyrs at Auray.

Quiberon Bay, BATTLE OF. Fought between the British and the French, Nov. 20, 1759. During the Seven Years War the French

Quichua. Two members of this S. American Indian tribe

planned an invasion of England. An army was assembled under the duc d'Aiguillon, which was to embark at Vannes, convoyed by the fleet of Conflans, while a squadron under Thurot, making a diversion against the coasts of Scotland and Ireland, decoyed the English Channel fleet away.

De la Clue was attempting to join Conflans at Brest, but was utterly defeated by Boscawen on Aug. 18. Meanwhile the troops had been assembled in the neighbourhood of Quiberon, and on Nov. 14 Conflans put to sea from Brest to safeguard the transports if he could. Hawke had been driven to Torbay by a great gale, but the wind that enabled Conflans to get out from Brest brought Hawke also to sea. Quiberon Bay lies about 150 m. S.E. of Ushant, and is protected on the W. and S.W. by the Quiberon peninsula, Belle Isle, and the dangerous rocks of the Cardinals. There Conflans hoped to remain until another gale should blow Hawke from his blockading station to shelter.

Conflans, making his way to Quiberon, did not suppose that his adversary would risk his fleet amid uncharted and dangerous rocks, with a gale blowing, on a grey day in Nov. But Hawke had measured the hazard. The signal was hoisted for a chase, and the English pressed on through the islands and shoals and towards a lee shore, and, ranging on both sides of the fleeing French, each ship fired her broadside and left the destruction to those who followed. English ships

were lost on the rocks, but the French fleet was utterly broken, some ships were captured, others lost or struck, and the flagship, *Soleil Royal*, was driven on shore and burned. Hawke's victory, which was without precedent, was complete; the French plan of invasion was shattered and the English command of the sea assured.

Quiché or **KICHÉ.** American Indian tribe of Maya stock in S. Guatemala. Now agricultural peasants, they were at the Spanish conquest the most powerful tribe in Guatemala, with a fortified capital at Utatlan. The allied Cakchikel were S.E. of them. In the 17th century a Christianised Guatemalan wrote in Quiché from local tradition an epic, *Popol Vuh*, recounting early migrations and tribal history. See Maya.

Quichua. South American Indian tribe and stock in Ecuador, Peru, and Bolivia. In the 13th century, led by the Inca clan, they absorbed earlier cultures established by the coast Yunca near Trujillo and by the upland Aymara or Colla round Lake Titicaca. At the Spanish conquest they ruled from Ecuador to Chile, a region 2,500 m. long, with cultural offshoots as far as the Argentine Calchaqui. The llama was domesticated for transport, the alpaca for wool. The political system was a state socialism under the autocratic rule of the Inca as priest-king. Roads and bridges betokened a highly systematised government, whose records were kept by quipus or knotted cords. The Quichua language is spoken today, from Quito to Argentina, by more than 2,000,000. It has given to Europe words like condor, guano, pampa. See Bolivia.

Quickening. First perception by the mother of the movements of the foetus while in the womb, generally felt about the end of the fourth month of pregnancy (*q.v.*).

Quicklime. Common name for calcium oxide, CaO. It is prepared on a large scale by burning limestone (calcium carbonate) mixed with coal in kilns. The limestone loses its carbon dioxide gas during the process. Shaft and rotary kilns are in general use. The lime-burning process is a continuous one, the limestone and coal being placed in the top of the kiln and the quicklime raked out at the bottom when sufficiently burnt.

Quicklime is employed for making mortar and cement for building purposes, and the product made in the manner stated varies according to the quality of the

limestone used. The builder distinguishes the quicklime obtained from a pure limestone as "fat," while that from limestone containing magnesia is spoken of as "poor" lime. Slaked lime is made from quicklime by pouring water over it, much heat being evolved during the process. The product known chemically as calcium hydroxide is used for making lime-water and in chemical industry.

Quickly, NELL. Character in Shakespeare's *King Henry the Fourth*, *King Henry the Fifth*, and *The Merry Wives of Windsor*. In the first of these, Mistress Quickly is hostess of the Boar's Head, Eastcheap. In *The Merry Wives* she is the housekeeper of Dr. Caius, the confidant of Anne Page's three lovers—Slender, Dr. Caius, and Fenton—and the go-between in the intrigues of Falstaff with Mistress Ford and Mistress Page. In *King Henry the Fifth* she is the wife of Pistol, describes Falstaff's death, and is said to have died in the Spital.

Quick Match. Simple fuse which burns rapidly and can be used for the ignition of gunpowder and similar explosives. It is generally prepared by boiling loose strands of cotton wick in a strong solution of gunpowder and gum, allowing them nearly to dry, and then, whilst they are "tacky," dusting them over with meal gunpowder. If unconfined this material burns at the rate of about twelve seconds per yard, but if enclosed in a tube burns much faster. Formerly it was used for both military and industrial blasting, but for this purpose has been entirely superseded by electric detonators, safety fuse, etc. It is now chiefly employed for fireworks, and to convey ignition rapidly to various components in certain types of shell.

Quicksand. Name given to a loose sand in which heavy bodies easily sink. Such sands are composed of small particles and water and do not coalesce under pressure. They are usually found near the mouths of rivers and in glacial deposits, and are generally small in extent. A heavy body on a quicksand behaves, as regards sinking, very much as it does in any fluid. If animals and human beings did not struggle when caught in one it is probable that they would not sink completely.

Quicksilver. Old English term, still used, for the metal mercury (*q.v.*). It was obviously suggested by the resemblance of mercury to silver and by its mobile character.

Quickstep. Type of ballroom dance with fast tempo, a variety of the foxtrot (*q.v.*).

Quickswood, HUGH RICHARD HEATHCOTE GASCOYNE CECIL, 1ST BARON (b. 1869). British politician,

Lord Quickswood,
British politician

born Oct. 14, 1869. Son of the 3rd marquess of Salisbury, he went to Eton and University College, Oxford. After serving his father as private secretary he represented Greenwich as Conservative M.P. 1895-1906, and Oxford university, 1910-37, his oratory and his compelling earnestness giving him prominence in the house. Ecclesiastical questions interested him predominantly, and as Lord Hugh Cecil he became known as a leading defender of the Church of England. He became a privy councillor in 1918, and was provost of Eton during 1936-44. In 1941 he was raised to the peerage. His publications included *Conservatism*; *Liberty and Authority*; *Nationalism and Catholicism*.

Quidde, LUDWIG (1858-1941). German historian and pacifist. Born at Bremen, March 23, 1858, he early specialised in history, founded the *German Review of historical science* in 1889, and was secretary of the Prussian historical institute at Rome, 1890-92. Two years later he attracted attention with a pamphlet, *Caligula*, directed against William II, for which he was imprisoned for three months. Member of the Bavarian diet 1907-19, he was president of the German peace society 1914-29, and a well-known figure at all international peace conferences. In 1927 he shared the Nobel peace prize with Buisson. After Hitler's advent to power in 1933, Quidde lived in Geneva. He died March 5, 1941. *Pron. Kvidda.*

Quietism. Form of mysticism which has arisen at various times and in various branches of the Church. Its distinctive principle is passivity and dependence on the manifestation of the Will of God as a guiding rule of life. Hence the Quietist practises entire resignation of self in thought, desire, and deed, and in this way seeks such union with God that the Will of God shall take the place of his own will, and his life be identified with the divine operation. Quietism has arisen in con-

nexion with various systems of philosophy and with several non-Christian religions, such as Buddhism. Meditation is the one essential practice of Quietism, but it differs from what is usually known by that term.

Christian meditation is an active mental process by which some doctrine or fact is recalled by the memory, reflected upon by the imagination, apprehended by the reason, and its lessons accepted by the will and adopted in the life. Quietism, on the other hand, teaches that meditation is not an act of the memory and reason, but is an inward, passive apprehension resulting from union with God apart from any exertion of the mind. It may be described as a kind of mental sleep which tends to self-hypnotism.

The name Quietism first came into use through the teachings of a Spanish priest, Miguel de Molinos (*q.v.*), whose book, *The Spiritual Guide*, published in 1675, ran through twenty editions in various languages in six years, and made converts of many eminent Roman cardinals and prelates. It was published in English in 1699.

Madame Guyon taught Quietism in France and was imprisoned for it in 1688 and again in 1695. She influenced Fénelon and gained adherents in France and Switzerland, but was strongly opposed by Bossuet. In Great Britain Quietism never made considerable headway, but the "inward light" of the Quakers has points in common with it. The objections raised by orthodox theologians to the system are that it tends to supersede faith in the Christian verities and to deprecate good works, and even constitutes a danger to souls by rejecting all exertion in religion and entirely excluding any struggle against evil habits or to attain good ones, or to help one's fellows. *See Hesychasts*; *Mysticism*.

Quilimane OR KILIMANE. Seaport of Mozambique. It is situated N. of the delta of the river Zambezi and 313 m. S.W. of Mozambique. It possesses an excellent harbour, and is the starting point of an important rly. to the border of Nyasaland. The dist. produces coconuts, copra, sugar, oilseeds, and sisal. Pop. 4,000, including about 500 Europeans.

Quill (Mid. E. *quille*, feather; etym. doubtful). Word used in several senses. (1) A piece of small tube or reed used by weavers to wind thread upon, and by others to carry wound silk or other thread (2) A plectrum of quill, as of a

goose, for plucking the strings of a musical instrument of the zither type. In an instrument of the harpsichord type, a piece of crow-quill, fixed on a jack, set in motion by the keys. (3) A small pipe or tube, particularly a small water pipe. (4) The hollow shaft of a seal engraver's lathe, in which the cutting tools are held during their rotation, the stones being held against them. (5) In mining, a train for igniting a blast. It comprised a quill filled with slow-burning powder, but is now superseded by a safety fuse. (6) The float of a fishing line. (7) A faucet or tap, as of a barrel. (8) A pen for writing, made by sharpening and splitting the hollow stem of a feather. (9) The spine of a hedgehog or a porcupine. *See Pen.*

Quiller-Couch, Sir Arthur Thomas (1863-1944). British writer. He was born at Bodmin,

Sir A. Quiller-Couch,
British writer

success with his first novel, *Dead Man's Rock*, 1887. He later wrote novels and stories of widely differing types, though mainly concerned, directly or indirectly, with Cornwall. These included *The Astonishing History of Troy Town*, 1888; *The Delectable Duchy*, 1893; *The Ship of Stars*, 1899; *Major Vigoureux*, 1907, and *Foe-Farrell*, 1918. His early fiction reflected the influence of Stevenson, whose unfinished novel, *St. Ives*, he completed 1899. His later work, especially *Foe-Farrell*, possibly his finest novel, shows the influence of Conrad.

Knighted in 1910, he became King Edward professor of English literature at Cambridge in 1912, his critical lectures, later published in book form as *On the Art of Writing*, 1916; *Studies in Literature*, 1918, 1922, and 1929; *On the Art of Reading*, 1920, attracting much attention. His *Oxford Book of English Verse* has been called the finest anthology since Palgrave. He also edited the *Oxford Book of English Prose*, and other anthologies, and wrote much verse, including *Poems and Ballads*, 1896. While his novels will probably be little read, except in the W. of England, Quiller-Couch

will long be remembered as critic and anthologist. He died May 14, 1944, his unfinished *Autobiography, Memories and Opinions* being published the same year. *Consuli Life*, F. Brittain, 1947. *Pron. Cooch.*

Quillota. Town of Chile, in the prov. of Valparaíso. It stands in a fine position on the river Aconcagua, 26 m. by rly. N.E. of Valparaíso and is the centre of a copper mining and fruit and wine producing district. Pop. est. 15,000. *Pron. Keel-yô-ta.*

Quillwort or **MERLIN'S GRASS** (*Isoetes lacustris*). Aquatic perennial herb of the family Isoetaceae.

It is a native of Europe, W. Siberia, and N. America. It grows at the bottom of lakes, and has a broad, flat, corm-like base, from which spring a dozen or twenty stiff awl-shaped leaves, which are composed internally of four tubes with transverse partitions. The spore capsules are of two kinds and borne within the leaf-bases.

Quilon. Town of Travancore, India. It is situated on the coast of the Arabian Sea, on one of the numerous backwaters which characterise this coast. Here the rly. from Trivandrum, 35 m. to the S.E., to Tinnevely and Madras leaves the coast. Coasting steamers make use of the backwaters and reach the town to take away for export copra, coffee, and spices. Marco Polo visited Quilon, which in the early days of Indian trade was one of the chief ports of the W. coast of the Deccan. In 1503 it was Portuguese, and in 1653 it was taken by the Dutch. Population (approx.) 21,000.

Quilp, DANIEL. One of the leading characters in Dickens's novel *The Old Curiosity Shop*. A hideous dwarf with a mind as distorted as his body, impish, cruel, and possessed of unflagging energy in the pursuit of his hatreds, he practises usury, one of his victims being Little Nell's grandfather. In the end he is drowned in the Thames while trying to evade the police.

Quilt (Lat. *culcita*, mattress). Bed-cover of down or other soft material enclosed in a fabric case. Quilting was formerly done with

the needle, a layer of wadding in terposed between upper and lower layers of cloth being stitched to form patterns standing in some relief. Loom quilting followed, a series of thick wadding threads replacing the loose fibre used as stuffing. A diversity of complex weaves are used in quilt weaving, upper and lower fabrics being woven simultaneously in the loom, while threads from the bottom fabric combine the two together; the Marseilles quilt is of this type. The satin quilt has a smooth surface with raised figures, and is made by the interplay of two separate sets of warp and two of weft. The Alhambra quilt is of rather simpler construction. The honeycomb quilt is a single fabric with a honeycomb pattern in low relief, and often with additional geometrical or floral figures. The tapestry quilt is a coloured one in which weft of different colours is used. Quilt weaving is done mainly in cotton, chiefly around Bolton and Bury, Lancashire.

Quilter, ROGER (b. 1877). British composer. He was born at Brighton, Nov. 1, 1877, was educated at Eton, and studied composition at Frankfurt. His settings of Shakespeare, notably songs from *Twelfth Night*, and *As You Like It*, appealed to such singers as Plunkett Greene and John Coates and thus became well known. His song-cycle *To Julia* (settings of Herrick), 1905, was followed by orchestral pieces, e.g. *Three English Dances*, 1910, and *Children's Overture*, and his incidental music for the fairy play *Where the Rainbow Ends*, 1911, was arranged as an orchestral suite. He also wrote the incidental music for a production of *As You Like It*, 1922, and his operetta *Julia* was produced in 1936.

Quimper. Town of Brittany, France, and capital of the dept. of Finistère. It stands on the river Odet, 36 m. S.E. of Brest. The cathedral of S. Corentin, the first stone of which was laid by Bertrand de Rosmadec in 1424, is one of the finest Gothic churches in Brittany, with beautiful lady chapel, fine choir, stained glass, mural paintings, and statuary. The ornate high altar is modern, as are the spires in the towers. There are potteries, shipbuilding yards, weaving and paper factories, and iron and copper foundries. There are a coasting trade and sardine fisheries. The town was besieged several times by the British. In 1345 it was destroyed by Charles de Blois. During the Revolution

Quillwort or
Merlin's Grass

Quimper, Brittany. Picturesque old houses above which are the twin spires of S. Corentin's Cathedral

it was known as Montagne-sur-Odet. It is the birthplace of Laennec (1781-1826), inventor of the stethoscope. In early times Quimper was the capital of Cornouailles. Pop. 20,149.

Quimperlé. Town of Brittany, France, in the dept. of Finistère. It stands at the confluence of the Ellé and the Isole, 92 m. S.E. of Brest. The church of S. Michel dates from the 14th-15th centuries, and that of Ste. Croix, restored 1862, is modelled on the church of the Holy Sepulchre at Jerusalem. Trade is carried on in wood, grain, cattle, butter, wax, honey, and hides. The place was known in the 6th century, when Gonthiern, a king of Cambria, after abdicating his throne, built a hermitage at the confluence of the two rivers. This was transformed in the 9th

century into an abbey, around which grew the modern town. Quimperlé dates its importance from 1271. Pop. 10,679.

Quin, JAMES (1693-1766). An English actor. Born in London of Irish descent, Feb. 24, 1693, and educated in Dublin, he came into notice by his rendering of Bajazet in Tamerlane at Drury Lane Theatre, London, 1715, and by killing a fellow actor in a duel. For many years he played leading parts at Lincoln's Inn Fields and Covent Garden. In 1746 he challenged comparison with Garrick, when he appeared as Horatio to his Lothario in *The Fair Penitent*, as Falstaff to his Hotspur in *Henry IV*, and as Gloucester to his Hastings in *Jane Shore*, both actors also impersonating Richard III. Quin retired in 1751, and died at Bath, Jan. 21, 1766. There is an anonymous *Life*, 1766, reprinted in revised form, 1887.

Quince. One of various trees and shrubs of the family Rosaceae, genus *Pyrus*. Native to Europe,

Quince. Branch with leaves and fruit; inset, flowers

Japan, and China, the common species was introduced into Britain in 1573. Quinces vary in height from 5 to 20 ft., and are readily propagated by layers or suckers in autumn. They flourish in moist soil. The pear-shaped, astringent, yellow fruit is used in jellies.

Quinet, PETER. Character in *A Midsummer Night's Dream*, by Shakespeare. A carpenter, he comes in as leader of six Athenian workmen and producer of the play they are to put on for Duke Theseus's wedding; but he is usually talked down by Nick Bottom. Quince, however, delivers the famous prologue in

which all the full stops are wrongly placed. See *Midsummer Night's Dream*.

Quincunx (Lat.). Arrangement of five things, one in each corner and one in the centre of a square or oblong space, as in playing-cards or dice. The term is applied to trees arranged in an orchard so that those in one row face the spaces between those in the neighbouring row; also to a reliquary, the four outer parts of which, two on each side, close over the central part. In the fighting formation of the Roman legion the maniples are said to have been arranged in quincunx order.

Quincy. City and river port of Illinois, U.S.A., the co. seat of Adams co. It stands opposite the state of Missouri on the Mississippi river, here spanned by a fine rly. bridge, 265 m. S.W. of Chicago, and gives its name to the Chicago, Burlington, and Quincy rly. Manufactures include stoves, pumps, boots and shoes, machinery, and show cases. Settled in 1821, Quincy was incorporated in 1834, and received a city charter in 1839. In the steamboat era it was a focal point in river traffic and the second city of Illinois. Pop. 40,469.

Quincy. City of Massachusetts, U.S.A., in Norfolk co. It is situated 8 m. S.E. of Boston and $1\frac{1}{2}$ m. from the sea, on the New York, New Haven, and Hartford rly. Quincy granite is exported in large quantities; the horse-rly. made 1826-27 to transport the granite for the Bunker Hill monument was the first rly. in the U.S.A. The city manufactures boots and shoes, soaps and chemicals, has a boatyard, and contains the Adams Academy and the Woodward Institute. It owes much to immigrants who entered quarries and shipyards in the 19th century. The old Quincy House, a fine specimen of colonial architecture, is a museum of Colonial and Revolutionary antiquities. John Hancock, John Adams, and his son John Quincy Adams were natives. Settled in 1625 as Mt. Wollaston, and one of the oldest inhabited places in the state, Quincy took its present name in 1792 and became a city in 1888. Population 75,810.

Quinet, EDGAR (1803-75). French author, born Feb. 17, 1803, at Bourg-en-Bresse. After extensive travels he was appointed professor in Lyons university 1839, and in the Collège de France, 1841. An active Radical in politics, he was exiled after the *coup d'état*, 1851, but returned to

Quimperlé, Brittany. Rue des Ecoles and the church of S. Michel

France on the fall of the empire. As an historian he is romantic in style but philosophic in purpose, seeking, as in his *Révolutions d'Italie* (1848) and *La Révolution* (1872), the inner significance of the facts presented. His other writings include a mystical treatise, *Du Génie des Religions*, 1842; *Ahasvérus*, a kind of allegorical miracle-play on the Wandering Jew; and the allegorical prose-epics, *Prométhée* and *Merlin l'Enchanteur*. He died at Versailles, March 27, 1875. *Consult* Life, R. Heath, 1881.

Quinine. Chief alkaloid present in the bark of the cinchona (*q.v.*) tree. Isolated in 1820 by Pelletier and Caventon, quinine is a whitish, micro-crystalline, odourless substance possessing a bitter taste which is intense and persistent. It forms a large number of salts, those most commonly used being the sulphate, bisulphate, hydrochloride, and dihydrochloride. Quinine has a well-established reputation in the treatment of malarial fevers, but the mechanism of its action is still uncertain. It is sometimes used to stimulate the gastric and salivary secretions in various forms of indigestion, and has an antipyretic action similar to that of aspirin and phenacetin. It is used as a sclerosing agent in the treatment of varicose veins. Excessive doses produce ringing in the ears, deafness, defects of vision, headache, and nausea. *Consult* The Fever Bark Tree, Duran-Reynals, 1847.

Quinoa (*Chenopodium quinoa*). Herb of the family Chenopodiaceae. It is a native of the Pacific slopes

for these seeds, which are boiled to furnish a gruel. Sometimes they are roasted before boiling.

Quinoline. Organic base originally prepared by distilling quinine with caustic potash. It also exists in coal-tar. It is a colourless, oily liquid with a faint aromatic odour recalling peppermint oil. Quinoline is made synthetically by heating a mixture of glycerin, aniline, nitrobenzene, and sulphuric acid.

Quinone, or BENZOQUINONE. Organic compound ($C_6H_4O_2$), first prepared by oxidising quinic acid, but now made by oxidising aniline with potassium dichromate and sulphuric acid. Quinone crystallises in golden-yellow prisms which readily sublime, emitting an acrid smell. The discovery that vitamin K is a naphthaquinone derivative has created new interest in the medicinal possibilities of quinone.

Quinquagesima (Lat. *quinquagesimus*, fiftieth). Term applied to the next Sunday before Lent. Quinquagesima Sunday falls 50 days before Easter, both inclusive. It was known as Shrove Sunday.

Quinquennial (Lat. *quinque*, five; *annus*, year). Something occurring every five years. It is also used for a period of five years, which is more correctly a quinquennium. A quinquennial valuation is a re-valuation of property, to assess it for rates, that takes place every five years.

Quinquereme (Lat. *quinque*, five; *remus*, oar). War vessel used in ancient times. The name is due to the fact that it had five banks of oars, one on top of the other. *See* Trireme.

Quinsy (late Lat. *quinsia*, from Gr. *kyōn*, dog; *anakein*, to throttle). Acute inflammation of the tonsil, accompanied by abscess formation. The use of the sulphadiazine and penicillin have made it less common and less menacing. *See* Tonsil.

Quintain. Instrument used during the age of chivalry in practising the art of tilting with the lance. Originally a stout post, it was developed into a device for discomfiting the unskilled man-at-arms. The humbler classes practised a similar variety of exercise, the target being so poised as to swing round and, unless skilfully evaded, deal a sharp blow from a sandbag hung from the other end of the crossbeam. This latter form

of the sport was a popular country amusement as late as the 18th century. The word is from Lat.

quintana, the part of a Roman camp devoted to military exercises.

Quintal. Measure of weight used in Spain, Portugal, and other countries. In Spain it is 100 libras, or 101.4 lb., in Portugal 58.752 kilogrammes or 129½ lb.

The weight is also used in S. America. The metrical quintal equals 100 kilogrammes or nearly 2 cwt.

Quintana, JOSÉ MANUEL (1772-1857). Spanish writer and politician. Born at Madrid, April

José M. Quintana
Spanish writer

11, 1772, and educated at Salamanca, he became an advanced republican, expressing his views in his *Lives of Celebrated Spaniards*, 1807-34, and in his poetry.

His advanced political views involved imprisonment for several years. Restored to favour in 1820, he was made a senator, and died March 11, 1857. He wrote plays, as well as a biography of Pizarro.

Quintana Roo. Federal territory of Mexico. Organized in 1902, it is situated in the Yucatan peninsula, and is bounded E. by the Caribbean Sea. It covers 19,438 sq. m. The capital is Chetumal. Pop., territory, 18,752.

Quintero. Name of two brothers, Spanish dramatists. Serafin Alvarez (1871-1938) was born at Utrera, Seville, and in collaboration with his brother Joaquín Alvarez (1873-1944) wrote over 200 works for the stage—dramas, comedies, farces, sketches. Best known in England and the U.S.A. are *The Lady from Alfaceque*. The Romantic Young Lady, *Don Abel Wrote a Tragedy*, and *A Hundred Years Old*. The brothers' plays, though sometimes lacking force, give a truthful, humorously sentimental picture of Spanish provincial life. A Hundred Years Old was produced at the Lyric Theatre, Hammersmith, 1928. Several of the comedies were translated by Helen and Harley Granville Barker. Serafin died April 13, 1938; Joaquín, June 14, 1944.

Quintet (Lat. *quinque*, five). Musical composition for five performers. The most celebrated

Quinoa Foliage and flower clusters:
inset, fruit

of the Andes. It attains a height of 5 ft., with a stout, furrowed stem and somewhat triangular-oval leaves with sinuate margins. The small green, clustered flowers are succeeded by small fruits, each containing a single round, flattened seed. The plant is cultivated

example for singers is in *The Mastersingers* by Wagner. The string quintet has never attracted composers as much as the quartet, but the addition of another instrument to four strings has resulted in fine works, among which may be mentioned the piano quintets of Schumann (op. 44) and Dvorak (op. 81) and the clarinet quintet of Brahms (op. 115).

Quintilian (c. A.D. 35-97). Roman rhetorician. His full name was Marcus Fabius Quintilianus. Born at Calagurris in Spain, he was educated at Rome, and returned to Spain as a teacher of oratory. His great work in 12 books, *The Institutes of Oratory*, represents the fruit of some 20 years' experience as professor of rhetoric and practical pleader in the law courts.

Grave Quintilian, as Pope called him, possessed a fine sense of literary criticism, and his appreciations of the leading Latin and Greek authors are of great interest. The final book, on education, is also of permanent importance. The broad and sane views which the author expresses on this subject anticipate some modern theories.

Quintuplets. Five infants born at one birth. The most famous modern example is the five daughters, Yvonne, Annette, Cécile, Émilie, and Marie, born to Mr. and Mrs. Olivia Dionne at Callander, Ontario, Canada, May 28, 1934. They were born in the log farmhouse of their parents in the space of 30 minutes, and were delivered by Dr. A. R. Dafoe (1883-1943), a local practitioner. Their aggregate weight at birth was 12 lb. 2½ oz.; the heaviest being Yvonne, 2 lb. 6½ oz., and the lightest Marie, 1 lb. 10 oz. They gained in weight rapidly and at the age of ten averaged 78 lb. By an Act of the Ontario legislature they became wards of the crown, their four guardians including their father.

This crown guardianship ceased with their 10th birthday, except financially. At that time they had contracts (mainly in advertising) yielding an annual income of \$30,000, and a reserve fund of \$1,000,000, held in trust until their 21st birthday. After they were ten, they lived with their parents and were educated at home by three nuns.

Quipu. Ancient Peruvian device of knotted strings for keeping records. From a stout cord depended a fringe of threads of different colours, sometimes with wood or stone pendants. The arrangement of knots and the order of the threads served to record

the results of the hunts, the number and composition of the llama herds, details of tribute, and matters connected with peace and war.

Quire. Measure of paper, the twentieth part of a ream, i.e. 24 sheets. The term is used also for small books or pamphlets which contain a quire of paper. A newspaper quire contains 27 copies, a printer's quire 25 sheets. The word was formerly used for four sheets of paper or parchment folded to make eight pages of a book.

Quirigua. Town of Guatemala, 110 m. N.E. of Guatemala city. Here the United Fruit Company maintains a model hospital. Near by are remains of a Mayan temple and carved monoliths. It is connected with Puerto Barrios (80 m.) by rly. Pop. approx. 4,000.

Quirinal (Lat. *Collis Quirinalis*). One of the seven hills on which Rome is built, 170 ft. in

Quirinal, Rome. Royal palace and, left, fountain and obelisk

height. Situate in the N.E. quarter, it was early seized by Sabines, and the name was popularly connected with Cures, an ancient Sabine town. The modern palace erected on the summit was founded by Gregory III in 1574; since 1870 it has been a royal palace. See *Quirites*; Rome.

Quirites. In Roman history, originally the Sabine inhabitants of the Quirinal. After the union of Sabines and Romans the name was applied to the individual old citizens, all of whom bore arms; collectively, to all the citizens of Rome. Later, the term was used for civilians as opposed to soldiers, to whom it was a reproach to be called Quirites. The word has been derived from Lat. *quiris* (Sabine, *curis*, a lance), or from Cures, a Sabine town. See Rome; Sabines. *Pron.* Kwiri-teez.

Quirk. Term applied in architecture to the groove or channel which separates the convex part of a moulding (*q.v.*) from the fillet that covers it.

Quisling, LAURITZ VIDKUN ABRAHAM (1887-1945). Norwegian politician. He was born at Fyres-

dal, July 18, 1887, studied at the Norwegian royal military academy, and graduated in 1911. He worked for Nansen, 1924-26, and for the League of Nations on the repatriation of Armenian refugees, then living chiefly in Moscow. On returning to Norway in 1929 he entered politics, a fanatical anti-Communist. In 1931 he became minister of defence, and later founded the Nasjonal Samling, a fascist party. After the German invasion, 1940, Quisling proclaimed himself prime minister, but since he had no political following the Germans dismissed his government. He obtained Hitler's personal support, and his party was made the state party, Quisling being appointed minister president—a puppet dictator—in 1942. With the German collapse in 1945, he surrendered to the Norwegian "home front" and after undergoing trial at Oslo was found guilty of treason, Sept. 10, and executed Oct. 24. He gave a new word to the languages of the world, his surname being adopted as the synonym for traitor.

Quito. City of Ecuador, capital of the prov. of Pichincha and of the republic. Picturesquely placed amid lofty volcanic peaks, at an alt. of 9,350 ft., it is 164 m. direct and 297 m. by rly. N.N.E. of Guayaquil, and lies just below the equator. Owing to its geographical position the temperature varies little, and day and night are always almost equal in length. The seat of the archbishop of Ecuador, it has a cathedral, presidential and archiepiscopal palaces, a mint, monasteries, university, etc. Manufactures include saddlery, ponchos, carpets, cotton and woollen

Quito, Ecuador. The picturesque setting of this Andean capital

goods, jewelry, and articles of Mexican "onyx." Hides and rubber are exported, and a large trade is carried on in oil paintings of religious subjects. Quito was an Indian capital before its capture by the Incas in 1470 and the Spaniards in 1534. The ancient road to Cuzco, built by the Incas, can still be traced. The city has suffered repeatedly from earthquakes and in the civil wars. Fifteen lives were lost and the local radio station burned down in riots in 1949 following a broadcast of Wells's War of the Worlds. Pop. 174,354. *Pron.* Kee-to.

Quit Rent (Lat. *quietus*, free, at rest). Rent by which a tenant secured release from all other services. Under feudal law the lord of the manor had some tenants who held by copy of court roll (copyholders) who were bound, in return for the land, to perform certain services so many days in the year, e.g. to plough the lord's land. With time it became customary for a money rent to be paid instead. When copyhold was abolished by the Law of Property Act, 1922, provision was made for extinguishing the surviving quit rents. *See* Copyhold; Manor.

Quoad Sacra (Lat., sacred thus far). Term used in Scottish local government. It describes parishes that are such for ecclesiastical purposes only, being thus different from civil parishes.

Quodlibet (Lat., what pleases you). Old musical term for the simultaneous performance of a number of different melodies, either prepared and modified so as to fit together, or more commonly sung extemporaneously for fun. The quodlibet, popular in the 16th and 17th centuries, was a favourite pastime of the Bachs.

Quoich. Loch or lake in the S.W. of Inverness-shire, Scotland. It is 6 m. long by $\frac{3}{4}$ m. broad. It receives the river Quoich (8 m. long) from the W., and is drained E. to Loch Garry by the river Garry. The head of this river is regarded as the wettest spot in Britain.

Quoin (Fr. *coin*, corner, wedge). In architecture, the stone block employed at the external corners of a building to emphasise its solidity and strength. A "rustic" quoin is roughened and raised above the general wall surface, so as to accentuate the differences between the former and the latter. The external angles of a building, whether of stone or brick, are also termed quoins. Blocked quoins are projecting blocks of brickwork, extending over several courses in

depth, used to give an effect resembling that of masonry quoins in a stone building. The word is also applied to the wedge used for tightening or locking up forms in printing. *See* Forme; Masonry.

Quoit. Weapon formerly used by certain tribes in India. It was a circular disk with a sharpened outer edge, and was thrown or skimmed along the ground against charging cavalry.

Quoits. Pastime which probably had its origin in England and Scotland in the 15th century. At the present day the game is played in Scotland, principally by mem-

Quoits. The diagrams show, A, a ringed quoit; B, a cutter; C, a quoit pitched true, and how the quoit should be held

bers of the various curling clubs, and in England by the workmen of Lancashire and the Midlands; also in the U.S.A. and Canada.

The playing area is formed of two beds of clay, each 3 ft. in diameter and generally situated 18 yds. apart from centre to centre. Into each centre is driven an iron pin, termed the hob, of which an inch remains exposed above the level of the ground. The quoit is a flattened ring of iron, thick at its inner and thin at its outer edge, not exceeding 8 ins. in diameter and usually weighing about 9 lb.

The object of the game is for the player, who stands at one end just outside the clay bed and in a line with the pin, to cast his quoit so that it falls over the pin at the far end—termed scoring a ringer—or as near to it as possible. Each player throws two quoits in succession, a ringer scoring two. Should neither player throw a ringer, the player whose quoits are nearest to the pin scores two; if only one of his quoits is nearest it counts one. If the two nearest quoits are at the same distance from the pin and belong to different players, neither scores. The players then throw to the other end, continuing until one of them has scored the number of points agreed upon for game.

Matches are played between single players or two on each side. All quoits which alight on their backs are foul, and in important matches it is usual to reckon all quoits as foul which are more than 18 ins. from the pin.

Quorn. Premier English hunt. The name is taken from Quorndon

in Leicestershire. The country hunted is regarded as the best for that sport in England. It is about 20 m. by 20 m. in area, Loughborough being roughly its centre, although Melton Mowbray is more frequented as such. The kennels are near Barrow-on-Soar, and the hounds are the property of members. The country is said to have been hunted in the latter part of the 17th century by Thomas Boothby with the first pack of foxhounds in England, but the pack was not definitely established until the 18th century under the master-ship of Hugo Meynell. Its masters have included Squire Osbaldeston, Assheton Smith, and the earl of Lonsdale. *See* Fox-hunting.

Quorra OR **KWARA.** Native name applied to the navigable section of the Niger river which flows through the Hausa country in the N.W. of Nigeria.

Quorum (Lat., of whom, or of which). Term used for the minimum number of persons necessary to form a meeting, at which the business of a company, club, or other association is transacted. Of public companies the articles of association usually declare what is the number of directors necessary to form a quorum, and in societies and associations it is laid down by rules or by-laws. In the British house of commons the quorum is forty, and in the house of lords thirty.

There is no general law on the subject of a quorum, but a proviso of this kind is necessary to prevent a mere handful of persons from binding the whole body by their action. In both chambers of congress of the U.S.A. and of the French parliament the quorum is a majority of the members of each house. The word was originally used in this sense in the commission appointing justices of the peace in England, and its later uses are derived therefrom.

Quota (Lat. *quotus*, how great?). In law, the proportion of a contribution, generally the proportion of a tax or levy by the crown. In England it was used for the number of men which the different towns and districts were expected to contribute to the armed forces, and also for the amount levied on the various localities on account of the land tax (*q.v.*). It is also used for the number of votes necessary

to secure election under a system of proportional representation (*q.v.*). The term is further used in matters political, economic, and social, when a total quantity has to be distributed among different nations or certain groups within a nation. Thus, in 1921 the U.S.A. fixed a quota of prospective immigrants, and from time to time varied the number admissible from individual countries. In 1931 France established a quota for the import of certain commodities, and later subdivided the total quantity to decide the quota of imports from various countries. Great Britain adopted a similar plan. Quotas were a usual feature of agreements entered into by the German Nazis with other countries. In 1948 import quotas for different classes of goods were enforced by most countries as a means of controlling foreign exchange and avoiding too large an excess of imports over exports. The draft charter of the international trade organization of U.N.O., speaking generally, prohibits import and export quotas and licensing systems, except in imports of agricultural produce and fish, or to safeguard the country's monetary reserves.

Production quotas were part of producers' restriction scheme in, *e.g.*, rubber (1922-28), sugar (1931-35), American cotton, Brazilian coffee. Sales quotas are part of the normal organization of cartels; but the temptation to the individual producer to break his agreement is one source of weakness in such combines, particularly when they are international in scope. The Cinematograph Films Acts, 1938 and 1948, established exhibitors' quotas, *i.e.* ratios between British and foreign films to be included in programmes. During the post-war shortage of steel, timber, paper, etc., individual users were allocated a quota or maximum share dependent to some extent on their pre-war consumption. In 1948 quotas were operated to control admittance of students to the universities.

Quotation. Passage extracted from the speech or writing of another. When the words are repeated exactly, or prefaced by a phrase like "as A. B. says," it is usual to put them within quotation marks, or to use some alternative device for distinguishing them, *e.g.* smaller type. But a wider class of quotations covers those phrases with which the user assumes his readers or hearers to be familiar. From whole passages in

Shakespeare or Pope every phrase has been borrowed so often as to become part of the language; despite alteration to its parts of speech or tenses, it is still recognizable. To say, "I felt like a fool rushing in," will not disguise the allusion to Pope's line, "For fools rush in where angels fear to tread." This is not the same as a misquotation, by which through ignorance or laziness a wrong word is admitted. In the last line of Milton's *Lycidas*, "fresh woods and pastures new" is almost universally misquoted as "fresh fields"; while one of Burns's finest lyrics is rendered nonsense by people who sing, "for the sake of auld lang syne," instead of "for auld lang syne."

The justification for quoting is that a phrase becomes quotable only because it deserves to; it sums up an idea or feeling in words more effective than any the borrower could invent for himself at the moment; by its universal quality a man can establish relationship with reader or hearer, referring him to a common experience—"what oft was felt, but ne'er so well expressed." "I quote others," declared Montaigne, "to express myself the better." A. S. M. Hutchinson, with *If Winter Comes*, 1921, started a vogue for quotations as titles for books and plays. The dangers of quoting are that language may be strained to fit the quotation; a phrase may be staled or blunted by repetition; the use of obscurer quotations, which does avoid this, may annoy the less widely educated.

Among numerous encyclopedias of quotations may be cited Riley's *Dictionary of Classical Quotations*; Cassell's *Classified Quotations*, ed. W. G. Benham; Bartlett's *Familiar Quotations*; Stevenson's *Book of Quotations*; The *Oxford Dictionary of Quotations* (ed. Bernard Darwin).

Quotation. The inclusion of a security in the stock exchange official daily list. This is published daily by the stock exchange, London, and contains details of the previous day's dealings. The securities quoted may be units of government and municipal loans, the stock of public bodies, or the shares or stock or debentures of public companies. The council of the stock exchange orders the quotation to be made, but imposes stringent conditions before a quotation is granted. Many securities are dealt with on the stock exchange, although no official quotation has been granted for them. Dealings in these "un-

quoted securities" are given in a supplementary list. It does not follow that an unquoted security is less respectable or trustworthy than a security for which a quotation has been obtained; but it may not be so readily marketable.

Quotidian Fever. Form of malaria in which there are recurring paroxysms every day (*Lat. quotidie*).

Quo Vadis (*Lat.*, Whither goest thou?). Title of a novel by the Polish writer Henryk Sienkiewicz (*q.v.*). It deals with the persecutions of the early Christians in Rome under Nero, and published in 1895, was first translated into English in 1896. It has been rendered into all the principal languages of the world. A dramatized version was produced at the Adelphi Theatre, London, in 1900, and an elaborate silent film of the story was made in Italy in 1912.

Quo Warranto (*Lat.*, by what warrant?). Writ of inquiry instituted in England by Edward I in 1278. The king had been seriously injured by encroachment on his royal privileges, and so he appointed commissions to examine the warrants by which various barons and corporations owned land and exercised jurisdiction. If the title was found defective the land could be recovered for the crown. It was when interrogated under one of them that Earl Warrenne threw down an old sword, telling the king's men that by that sword his ancestors had won his lands, and by the same sword he would keep them.

In modern times there was an information in the nature of a quo warranto by which a person who claimed to hold an office could be required to prove his right to it, or a body claiming to be a corporation could be asked to justify its claim. The procedure was abolished as to local authorities in 1933, and all informations of this nature were swept away in 1938. The procedure now against a person claiming to hold an office is by way of injunction; and no order will be made if he has acted in the office for the previous six years.

Qurna, EL, OR KURNA. Town of Iraq. It stands on the Tigris, 45 m. N.W. of Basra. Of strategic importance, it is built on an ancient site, though at the time of the Assyrian and Babylonian empires it was probably submerged under the headwaters of the Persian Gulf. In the district is the traditional site of the Garden of Eden. The town was occupied by British troops in 1915.

THE letter R is commonly accepted as descending directly from the Egyptian hieroglyph of the 5th cent. B.C., representing a mouth. The later cursive form (hieratic) of this was and this reappeared in the Hebrew and Phoenician inscribed alphabets thus :

◁, to which figure was given the name *resh*, head, from its pictorial suggestion of a human head and neck.

As with the precursors of other letters, e.g. B, C, E, K, the early Greeks began to reverse the *resh*: Ϻ, sometimes adding a short tail: ϻ. Thus the classic Greek form, the *rho*, a ϱ rounded version of the revised *resh*, exactly resembled

our letter P. But the Roman P was developed from the Greek *pi* (see P). Taking over the *rho*, the Romans therefore found it necessary to reintroduce the tail, but the classic Roman alphabet added length and dignity to that tail to produce the letter in its familiar form.

The changes in the minuscule are more subtle. The cursive pen form gradually eliminated the loop, running loop and tail into one vague stroke. One 7th century form was ϱ, which may be seen as the parent of a form ϱ commonly used in informal writing today. A development of this in later MSS. was ϱ, forming a link between the 7th century form and the r of modern typography.

R Eighteenth letter of the English and Latin alphabets, one of the two liquid consonants, *l* being the other. Its normal sound is that in *rat*, *road*, and softer in *lord*. In England it is usually almost inaudible at the end of words, unless a vowel follows; in *a good mother* the *r* is almost inaudible, but in *the mother of three* it is distinctly heard. The "intrusive *r*" is similarly but wrongly introduced in, e.g., "the India Roffice." In Scotland *r* is generally more strongly stressed. In words like *centre* the position of *r* and *e* is reversed as in *-le*, *centre* being pronounced, and in the U.S.A. generally written, *center*. *R* exercises a distinct influence on the sound of the vowels; it changes short *a* into the long Italian *a*, e.g. *can*, *car*, and short *o* into broad *o* or *aw*, as in *not*, *nor*. *R* is mute in *worsted* (yarn), but is audible in *worsted* (defeated). See Alphabet; Phonetics.

R.34. British airship. Launched in 1919, it had a gas capacity of nearly 2,000,000 cub. ft., was 643 ft. long, and had a maximum diameter of 79 ft. It was fitted with five Sunbeam aero engines, each of 250 h.p. In the year of launching it flew the Atlantic in each direction, the first airship to do so. In Jan., 1921, the airship met with disaster, colliding with a hill in Yorkshire, and, though reaching the Howden aerodrome, became a total wreck. See Airship and illus., p. 227.

R.38. British airship. When built in 1921, it was the biggest airship in the world, with a gas capacity of over 2,700,000 cub. ft., a length of 700 ft., and a maximum diameter of 85 ft. Intended for service with the U.S. navy, the R.38, which had six Sunbeam engines each of 350 h.p., buckled and broke in two during turning trials over the Humber, Aug. 24. Only five out of the company of 49 were saved.

R.101. British airship. Built in 1929, it had a gas capacity of over 5,000,000 cub. ft., a length of 724 ft. (later increased by a further 45 ft. by the addition of an extra bay), and a maximum diam. of 132 ft. On Oct. 5, 1930, on its first flight, bound for India, it was wrecked near Beauvais, France, only six of the 54 persons on board escaping when it burst into flames; victims included Lord Thomson, secretary of state for Air, and Sir Sefton

Horus of Edfu, he became hawk-headed, with sun-disk and uraeus (serpent head-dress). From the Vth dynasty every king bore a Ra-name. See Amen-Ra; Egypt.

Raab, or **RABA**. River of Hungary. Rising in the E. Alps in Styria, it flows for 160 m. along a curved course through Hungary to join the Little Danube at Győr. Raab was also the German name for the city of Győr (*q.v.*).

Raabe, **WILHELM** (1831-1910). German novelist. Born at Eschers-

R.101. After the disaster near Beauvais, France, October 5, 1930, when 48 persons, out of the 54 aboard, lost their lives. The airship was on her maiden voyage from Cardington, Beds, bound for India

Brancker, designer of the ship. It had five engines of 480 h.p. Its sister ship, the R.100, which had crossed the Atlantic in 1930, was dismantled in 1931, following the R.101 disaster. See Airship and illus., p. 227.

Ra or **Rē**. Egyptian Sun-god. Represented as a solar disk traversing the sky in a bark, incense was offered to him at dawn, noon, and sunset. At Heliopolis his principal temple was erected in the XIIth dynasty. Assimilated to

hausen, Sept. 8, 1831, he made a success in 1857, with *Die Chronik der Sperlingsgasse*, which, as did all his works, appeared under the *nom de plume* of Jakob Corvinus. His characters were largely drawn from the country folk of Brunswick, and were delineated with pathos and humour. His principal novels were *Der Hungerpastor*, 1864; *Abu Telfan*, 1868; *Prinzessen Fisch*, 1883; *Hastenbeck*, 1899; *Altershausen*, 1911. He died at Brunswick, Nov. 15, 1910.

Consult Works, 4 vols., 1896-1900; *Lives*, P. Gerber, 1897; W. Brandes, 1901.

Raasay. Island of the Inner Hebrides, Inverness-shire, Scotland. It is separated from the Isle of Skye by the Sound of Raasay. The surface is generally hilly in the S. and barren towards the N. On the E. coast are the ruins of Brochel Castle, a stronghold of the Macleods. The length of Raasay is 12 m.; breadth from 1 to 3 m.

Rab. This Yugoslav island of the Adriatic is described under its Italian name Arbe.

Rabah Zobeir (c. 1846-1900). African chieftain. Of mixed Arab and negro blood, he was born a slave, but rose to the command of Zobeir pasha's slave-raiding forces in Bahr-el-Ghazal. Defeated by the khedive, 1879, he fled to Central Africa, where he carried out slave raids and depredations. Seizing 300 rifles from the baggage of a murdered French explorer, Paul Crampel, in 1893, he deposed the sultan of Bornu (Lake Chad), and in 1897 attacked the sultan of Bagirmi, driving him and the French resident from the country. A French punitive expedition was dispatched in 1899, and after three battles, routed his forces and slew Rabah, April 22, 1900.

Rabat. Seaport and capital of French Morocco. It stands on the Atlantic coast at the mouth of the river Ragreb, opposite Sallee or Sali, and was once the chief port for European commerce. It is connected by rly. with Fez (q.v.) and Casablanca (q.v.). Olive oil, wool, skins, bones, and wheat are exported; carpets and textiles are manufactured. Here the sultan of Morocco and the French administration have their headquarters. There are law courts and schools for higher education. When the Allies invaded N. Africa in the Second Great War, Rabat was occupied by U.S. troops on Nov. 11, 1942, after Admiral Michelier had requested an armistice. The port became a centre for supplies and reinforcements to the Allied troops. Pop. 148,000.

Rabaul. Former seaport on the N.E. coast of New Britain, Pacific Ocean. Until the Second Great War it was the administrative centre of that part of New Guinea under Australian mandate. It is 14 m. N.W. of Kokopo, the designated new capital of the island. Destroyed by volcanic eruption on May 31, 1937, it was being rebuilt and had an anchorage and wharf, with regular steamship services to Australia, and fine public gardens.

On Jan. 4, 1942, Rabaul was first attacked by waves of Japanese bombers. Troops landing on the 23rd met with bitter opposition from the garrison, but the town was in Japanese hands by the end of Jan. As one of their aircraft and supply bases it was repeatedly bombed by the R.A.A.F., especially early in 1944, when huge supply dumps and underground fortifications had been installed. The capitulation of Japanese forces in the S.W. Pacific was received by Lieut.-Gen. Sturdee, Australian 1st army, off Rabaul, Sept. 9, 1945. War damage to the town was so great that it was not rebuilt.

Rabba. Town of Northern Nigeria. On the left bank of the Niger, it is about 200 m. above the confluence of the Niger and Benue rivers, and a few m. below Jebba. When visited by Richard Lander in 1830, it was a place of importance as a commercial and slave market with 40,000 inhabitants, but it has now only a small population.

Rabbah or **RABBATH.** Chief city of the Ammonites (q.v.). Situated in the mts. of Gilead, it has been identified with the modern Amman. Here Uriah the Hittite, set in the forefront of battle during the siege of the place, lost his life. At Rabbah Conder found a huge stone throne which he thought to be the "bedstead" of Og, king of Bashan. The city is the subject of denunciation in several O.T. prophecies (Deut. 3, v. 11; 2 Sam. 11, v. 17; Jer. 49, vv. 1-3; Ezek. 21, v. 20, 25, v. 5).

Rabbeth, SAMUEL (1857-84). British medical man, who took his degree at King's College, London. In 1884, when working at the Royal Free Hospital, London, to save the life of a child suffering from diphtheria he sucked the throat, and, taking the infection, died Oct. 20, 1884. This heroism is commemorated by cots at the hospitals and by a scholarship at King's College.

Rabbi (Hebrew, my master). Jewish title for a teacher (Matt. 23, v. 7). The term is now commonly applied to any member of the Jewish clergy. Christ was addressed as Rabbi (John 1, 3, and 6). Among Jewish scholars Judah, the editor of the Mishnah, is known as the *r a b b i*. See Jews.

Rabbi in ecclesiastical robes

Rabbit (*Oryctolagus cuniculus*). Animal belonging to the order Rodentia, or gnawing mammals. With the hare it is set apart from the rest of the rodents by the presence of an additional pair of incisor teeth in the upper jaw.

The rabbit is distinguished from the hare (*Lepus*) by its smaller size, shorter ears, legs, and feet, and grey colour. There are also differences in the relative length of the bones of the legs and in the habits of the two animals. Whereas hares are solitary, and crouch in furrows or in hollows under herb-
age, rabbits are gregarious and live in burrows. They are also much less fleet of foot.

The origin of the rabbit has been the subject of much debate, and is still very obscure. Its remains do not occur in prehistoric encampments, and the fact that its bones have been found in cave deposits with those of extinct animals proves nothing, as the burrowing habits of the animal may account for it. There is no record of its introduction to the British Isles. It has been assumed, but without any proof, to have been brought by the Romans. At any rate, it was common in England in the 12th century, but in the Highlands of Scotland it was unknown a hundred years ago.

The rabbit is a nocturnal animal, feeding in the late evening and early morning; but in quiet spots it may be seen about at all hours of the day. Owing to its large numbers, it is a most destructive creature in plantations and gardens. Its fur is made into cheap imitations of better kinds, and is felted for the production of hats.

As the rabbit often has four or five litters in the year, and the young ones are ready to breed at six months old, it multiplies at a prodigious rate if not kept down. One pair under favourable circumstances could have a progeny of over 13 millions in three years. In Australia the introduction of this rodent has resulted in a most serious menace to agriculture.

The rabbit is largely kept in captivity, as a pet and for commercial purposes, and its domestication has brought about many changes in size, colour, and form. One of the most curious is a modification of the skull, which causes the ears to droop instead of standing erect. The large "double-lop" is a favourite breed with the fancier.

The so-called Belgian hare, which is really a modified rabbit, attains a large size, and is normally imported in large numbers to Great

Britain for consumption as food. The Angora is known by its long, woolly fur and the Himalayan is a colour variety produced by crossing a silver-grey and a chinchilla. The Dutch fancy rabbit is noted for its small size.

RABBIT FARMING. The flesh and pelt of the rabbit are both of value, and the considerable demand in Great Britain has been largely met by importation, chiefly from Australasia. There is ample scope in the U.K. for controlled production of rabbits, either in properly managed warrens or on rabbit farms. In warrens most of the animals must be killed off before the end of the year, restocking in January or February; this enables the ground to get clean. Tame rabbits should not be introduced into the warren. Hay is used in racks for winter feeding, and can be supplemented by a small amount of maize. Turnips should be avoided.

RABBIT SHOOTING. Under the Ground Game Act the tenant farmer may shoot rabbits on his farm, although the sporting rights are reserved to the landlord. The two modes of shooting rabbits are by a special battue or taking them as a chance variety of ground game when out pheasant and partridge shooting. Beating for rabbits in covers should be accomplished by the beaters poking them out: a rabbit will run from the least prod with a stick but if struck may be beaten to death before it will run. It is practically impossible to drive them up-wind to guns, their sense of smell being so remarkably keen. In getting rabbits out into the open for shooting, the openings of their burrows should be plentifully besprinkled with gas-tar daily for three or four days previous to the shoot, when, owing to their dislike of the smell of the gas-tar, they will vacate their burrows and lie out in the adjacent fields. Another method widely used is to employ ferrets to drive the rabbits from their burrows.

Rabelais, François (c. 1490–c. 1553). French author. Born at Chinon in Touraine, where his father was an apothecary, he was educated for the Church, and about 1509 entered the Franciscan monastery of Fontenay-le-Comte in Poitou. But here his enthusiasm for humanistic studies aroused the hostility of his superiors, and in

Rabbit. Types of familiar breeds. Top, common wild rabbit (left) and white-furred breed. Beneath those (reading downwards): Chinchilla rabbit, silver rabbit, Angora rabbit

1524 he obtained permission to transfer himself to the less austere order of Benedictines, in which he remained till 1530, when he abjured the ascetic life altogether. His Greek text of the Aphorisms

François Rabelais, one of the world's greatest satirists
From a painting in the Louvre

of Hippocrates, 1532, was the first to appear since that of Galen in the 2nd century.

Inspired by a passion for science, he then took up the study of medicine, received his doctor's

degree at Montpellier in 1537, lectured, edited a number of medical works, and practised in the hospitals at Lyons. In the meantime Rabelais had visited Italy, in 1534 and 1536, in the suite of Cardinal du Bellay, with whom he again went to Rome in 1549. In 1546–47 he was town physician at Metz, and in 1550–52 curé of Meudon. He removed to Paris in 1553 and died there, it is supposed, shortly after his arrival.

Rabelais' one great work in literature, produced at intervals amid his other avocations, is a series of chronicles narrating the adventures of two mythical giants—*La Vie très horrible et terrible de Gargantua, forming Book I, and Pantagruel, Roy des Dipsodes, avec ses Faicts et Prouesses Espouvantables, Books II–V*; though the authenticity of Book V, which was not published till twelve years after his death, is uncertain. Superficially viewed, these chronicles are nothing but an immense, rambling burlesque: *roman d'aventures*, in which the author's amazing humour runs riot amidst the wildest extravagances and the grossest obscenities. But Rabelais was not only a great humorist; he was also one of the boldest and most progressive thinkers of his time; and he deliberately adopted his farcical machinery as the vehicle of his opinions on many subjects which it was then dangerous to discuss in earnest. Even so, the theologians came to perceive the revolutionary potency of his teaching, with the result that the fourth book was condemned by the Sorbonne and prohibited by the Parlement of Paris.

Modern criticism is probably inclined to read too much system into his philosophy; but its main drift is clear. It rests ultimately upon the heretical belief in the absolute goodness of nature and what is natural, and as this belief involved the principle of freedom for life and thought, it brought him into collision with both the old and the new school of theology. But though he did not spare the Calvinists, his fiercest satire is directed against medieval Catholicism, and especially against its

dogmatic tyranny, the intellectual submissiveness inculcated by it, and its asceticism. Rabelais' work was translated into English by Sir Thomas Urquhart and Pierre Motteux, 1653-94. Sir Thomas Urquhart translated Books I and II in 1653; Book III appeared in 1693, and Books IV-V, by Pierre Motteux, in 1694. This joint version has often been reprinted, notably in the Tudor Translations, 3 vols., 1900. A modern translation, by W. F. Smith, 2 vols., 1893, contains minor writings, letters, and other documents of interest. A monument to Rabelais, in the grounds of the university of Montpellier was unveiled by Millerand, then president of France, in 1921. *Pron.* Rabblay.

Bibliography. Lives, W. Besant, 1885; R. Millet, 1892; A. Tilley, 1907; W. F. Smith, 1918; J. Plattard, 1930; S. Putnam, 1930; J. C. Porcys, 1948.

Rabi, ISIDORE ISAAC (b. 1898). An Austrian-born American physicist. Soon after his birth, July 29, 1898, he went to the U.S.A. with his parents. He served as a private in the U.S. army in the First Great War, and then went to Cornell university. Ph.D. in 1927, he worked for two years as physics tutor in New York, and in 1929 became assistant professor at Columbia university. Promoted to associate professor in 1935, he took the chair of physics in 1937. His main interest was the electrical and magnetic properties of atomic nuclei, as shown by their spectra, and for his work in this field he was awarded the Nobel prize for physics in 1944.

Rabies (Lat. *rabere*, to rave). Disease due to infection by a micro-organism usually conveyed by the bite of a dog. It is generally applied only to the condition as manifested in the dog. When transmitted to human beings it is more often called hydrophobia (*g.v.*). For precautions against epidemics of the disease, see Muzzling Order.

Raby Castle. Seat of Lord Barnard. It is in Durham, 5 m. from Barnard Castle, overlooking the Tees. The original castle was built by a Neville before 1400, but most of the present building is of somewhat later date. One of the finest specimens of a feudal castle in England, it is surrounded by ramparts and a moat, and has a keep, a machicolated gateway, and some massive towers. The baron's hall is the chief feature of its magnificent interior. In the 17th century it was bought by Sir

Henry Vane; it was later the chief seat of his descendants, the dukes of Cleveland, passing to another Vane, Lord Barnard, on the extinction of the dukedom in 1891.

Racahout (Fr.). Farina from the edible acorn of the Barbary oak. It is flavoured, and used in much the same manner as arrowroot. Substitutes may be made with chocolate, sugar, tapioca and potato flour, and vanilla.

Racalmuto. Town of Sicily, in the prov. of Agrigento. It is situated in a hilly district, 13 m. by rly. N.E. of Agrigento, and trades in wine and olive oil. There are mines of quick silver, sulphur, and salt in the vicinity. Population est. 16,000.

Raconigi. Town of Italy, in the prov. of Cuneo. It stands on the river Maira, in a fertile plain, 23 m. by rly. S. of Turin. The royal chateau, built in 1570, but since considerably enlarged and restored, has a fine park laid out in French style. The chief manufactures are connected with silk and woollen goods, and there is trade in local produce. Pop. est. 11,000.

Race (Fr., from Ital. *razza*). Term meaning a group of interbreeding organic beings possessing a large number of characteristics in common. Mankind forms as a whole the human race, having the erect posture, the hand, helpless infancy, paucity of body hair, the large brain, good stereoscopic vision, and a number of other features in common, and descent from ancestors in various regions, these ancestors, like man, ranging widely and intermingling. Language, religion, and political allegiance are not to be used as indications of race, though differences in these matters may form social bars to marriage and so tend to accentuate physical differences in the course of millennia. It is, therefore, incorrect to speak of an Aryan race or a British or a Latin race.

Man is unique in the animal world in that he has contrived to live in all climates except that of the Antarctic continent, and he has drifted from one region to another at several stages in his history of about 600,000 years. Many early drifts were S. of the great Pleistocene ice sheets of the Scandinavian, Alpine, Caucasian, and inner Asiatic heights, into regions with strong ultraviolet radiation where, as a protection against excess of this radiation, the pigment of the skin increased, becoming almost black in certain exposed regions. In cool, cloudy

lands where there is little of this radiation the pigment is reduced to vanishing point; in areas of very cold winters with blue skies the skin is so dense as to be yellowish or yellow brown.

From central Asia peoples with yellow brown skin have drifted to the Arctic, where the brown tint protects them against snow glare, and they have also drifted via Arctic Asia to America. Some, the Redskins of America, have a slight red tint in the yellow brown.

Most early drifts of Old Stone Age men were apparently of very long-headed peoples with strong brows and cheekbones. Later drifts were often, especially S. of the ice sheets, of more moderately long-headed people with less bony faces. Among the mts. of the N. hemisphere between the Pyrenees, Alps, Carpathians, Caucasus, and central Asian ranges spread broad-headed peoples many of whom in central Asia became flat-faced through the sinking in of the nasal chambers. Some of these peoples drifted, probably comparatively late, to America. Pygmy peoples in some African and Malaysian forests are broad-headed.

Of the peoples who spread in the warm regions S. of the Pleistocene ice sheets some, chiefly in Africa, Papua, and Melanesia, had or developed loose skin pores, giving the head hair an irregular growth with the result that the hair is kinky. But the dark skinned people surviving in Indian jungles rarely show this hair form, their hair usually being wavy or curly like that of Europeans. The hair of the Australian aborigines and of the Polynesians is always curly or wavy. The extinct Tasmanian, probably from Melanesia, had kinky hair.

Most of the physical peculiarities noted are specialisations which are irreversible. In modern times white skinned Europeans have spread into Siberia, Australia, New Zealand, S. Africa, and America. In Latin America many of them have mingled with the older populations. W. African peoples taken to the U.S.A., the W. Indies, Guiana, and Brazil as slaves have mingled with the white skinned and other peoples of those regions. Yellow-brown skinned peoples have migrated to Malaysia, Sumatra, Java, Borneo, etc., and also to Madagascar. India has sent emigrants to Burma, E. Africa, and S. Africa. The Polynesian peoples are migrants from S.E. Asia who seem to have voyaged through Melanesia, reach-

ing their present homes six or more centuries ago.

Europe, except the Arctic, has white-skinned, wavy-haired peoples, usually long-headed in S. and W., broad-headed in the centre. Towards the N.W. depigmentation becomes so marked that eyes lack brown colour and so show as grey or blue while hair may be blonde. In N. Africa and S.W. Asia the same characteristics are found as in S. Europe, but with more brown in the skin. India, again, shows the same characters, sometimes with very dark skins. Africa S. of the Sahara and Abyssinia (Ethiopia) has people with dark skins and kinky hair, also very prominent lips and nasal openings that no doubt promote cooling of the body by evaporation. Central, E., and N. Asia, except for the recent immigrants from European Russia, has people with dense yellow skins, or yellow-brown skins, and hair that is coarse and straight growing in hair pores that fit tightly around the hair.

The white-skinned Europeans are often called Caucasians and the yellow or yellow-brown skinned people Mongolians; but it would be wrong to classify the wavy haired Australian aborigines with the people of intertropical Africa because of their dark skins. These Australians are more nearly related to the dark-skinned people of S. India. The so-called Caucasian and Mongolian groups include very long-headed, moderately long-headed, and broad-headed elements which in some countries have mingled inextricably. The people of Africa S. of the Sahara are nearly all long-headed. The people of India include all grades of head breadth, and so do the pre-European peoples of America and Polynesia. The Australian aborigines are the remnant of a very early drift of extreme long-heads.

Racecourse. Ground on which horse races are held. There are three kinds of racecourse, the hurdle-race, the steeplechase, and the flat-race course. The flat-race course, as the name implies, is for races without obstacles. The hurdle-race course must have at least six hurdles, not less than 3 ft. 6 ins. high, in the first mile and a half, and at least one for each additional $\frac{1}{4}$ m. The steeplechase course must have (a) at least 12 fences, excluding hurdles, in the first 2 m. and at least six more in each additional m.; (b) at least one ditch, not less than 6 ft. wide and 2 ft. deep; and (c) a water jump

not less than 12 ft. wide and 2 ft. deep. The distance of flat races varies from 5 furlongs to 2 $\frac{1}{2}$ m., and of hurdle races and steeplechases from 2 m. to a little more than 4 m., except for hurdle races for three-year-olds, which from Sept. 1 to Dec. 31 inclusive may be run over a minimum distance of 1 $\frac{1}{2}$ m.

Among the principal racecourses in the U.K. are those at Epsom, where the Derby Stakes is run, Ascot, Chester, Leicester, Lincoln, Goodwood, Newmarket, Doncaster, Manchester, York, Liverpool (Aintree), Hurst Park, Ayr, and Edinburgh. Aintree is the scene of the Grand National, the most important steeplechase event. Newmarket is the English racing headquarters, the Curragh holding a similar position in Eire. See Derby; Goodwood; Horse-racing; Longchamps; Newmarket, etc.

Raceme (Lat. *racemus*, a cluster of grapes). Botanical term for that form of flower grouping (inflorescence) in which the separate flowers are arranged on short lateral stalks from a central axis. Familiar examples may be found in the bluebell and the barberry. The raceme is a type of what is known as the monopodial inflorescence, in which the main shoot continues to lengthen, whilst giving off side branches in succession, each of the latter terminating in a flower. See Flower; Inflorescence.

Racemic Acid. Organic acid discovered by Kestner in 1822, as a by-product in the manufacture of tartaric acid, with which it is isomeric. Racemic acid can be produced by heating tartaric acid with water for thirty hours, at a temperature of 175°C. It is a crystalline body, less soluble in water than tartaric acid.

Rachel. In the O.T., younger daughter of Laban, sister of Leah, favourite wife of Jacob, and mother of Joseph and Benjamin. With Leah she took Jacob's part in his quarrel with Laban. She died in giving birth to Benjamin. The Jewish captives of Nebuchadnezzar passed her tomb on their way to exile (Gen. 29, 31, 35; 1 Sam. 10; Jer. 31; Matt. 2). Over the traditional tomb of Rachel Moses Montefiore erected a small hut in 1849, and in 1867 Rabbi Zwi Kalischer bought a tract of the surrounding land, which his son presented to the Jewish community at Jerusalem.

Rachel (1821-58). A French actress, whose real name was Elizabeth Félix. Born March 24, 1821, at Mumpf, Switzerland,

the daughter of poor Jewish pedlars, she sang in the streets as a child, being later trained by Étienne Choron.

Rachel,
French actress

She was admitted into the Paris Conservatoire in 1833. She made her début at the Théâtre Français, June 12, 1838, as Camille in Corneille's *Horace*, subsequently playing Roxane, in Racine's *Bajazet*, and (her greatest triumph) *Phèdre*. Rachel

created a sensation in London in 1841 and 1842, and won immense applause all over Europe as a tragic actress of supreme genius. She died of tuberculosis at Cannes, Jan. 3, 1858. *Consult* Lives, J. Janin, 1858; Mrs. A. Kennard, 1885; F. H. Gribble, 1911; J. Agate, 1928. *Pron.* Rashel.

Rachmaninov, SERGEI VASSILEVITCH (1873-1943). Russian composer and pianist. He went from Novgorod, where he was born April 1, 1873, to study at St. Petersburg conservatoire and under Arensky at Moscow. A one-act opera, *Aleko*, won the gold medal for composition in 1892.

Rachmaninov made a success in London, 1899, as conductor and performer of his own music, including the celebrated prelude in C sharp minor. He taught in Moscow from 1903, lived at Dresden, 1906-09, then conducted at Boston, Mass., was engaged for the opera at St. Petersburg in 1912, and after the Revolution escaped to the U.S.A. Thence he made frequent concert tours until his death at Beverly Hills, March 28, 1943.

As to the virtuosity of his playing, there were no two opinions. His standing as composer is harder to judge because of the excessive popularity of some works. Among these is the second piano concerto in C minor, 1901, with the pathos of its extended melodies; though the third concerto in D minor, 1909, is equally attractive and more complex. Rivaling all, the Rhapsody on a theme of Paganini, 1934, was his last big work. His

S. V. Rachmaninov,
Russian composer

symphonies have been overshadowed; the failure of the first drove him to depression from which he was roused by hypnotism. His own favourite works were *The Bells*, for chorus and orchestra, and a *Vesper Mass*. An elegiac trio in memory of Tchaikovsky deserves hearing; and his songs and piano pieces are exquisite. Rachmaninov's memoirs, as told to O. von Riesemann, appeared in 1934; a *Life*, by W. Lyle, in 1939. Benno Moiseiwitsch (*q.v.*) was his outstanding disciple.

Racine. Third city of Wisconsin, U.S.A., the co. seat of Racine co. It lies at the mouth of Root river, on Lake Michigan, 24 m. S. by E. of Milwaukee, on main rlys. It contains Racine and Luther colleges. Highly industrialised and possessing a good harbour, it carries on a large trade in manufactured products—wagons, carriages, motor vehicles, agricultural machinery, boots and shoes, hardware, and tobacco. Racine was settled in 1834, incorporated in 1843, and became a city in 1848. A Czech community was founded c. 1860, several Danes followed, and these account for over half the inhabitants. Pop. 67,195.

Racine, JEAN (1639–99). French dramatist. Early left an orphan, he was brought up by his grandmother, a woman of strong Jansenist leanings, and through her influence was at 16 admitted to the school of Port-Royal, where he devoted himself with ardour to the study of Greek literature. Thence he passed to the Collège d'Harcourt, on leaving which he gave himself up, to the great distress of his Jansenist friends, to worldly society and pursuits. He soon attracted attention by some odes, for one of which, on Louis XIV's marriage, he was given a hundred livres from the royal purse.

Racine
From an engraving
by G. Edelinck

Meanwhile he had become intimate with Boileau, La Fontaine, and Molière, the last named of whom produced his first tragedies, *La Thébaïde*, 1664, and *Alexandre*, 1665. At this time he entered into an acrimonious controversy with the famous Jansenist Nicole, on the subject of the drama, which completed his rupture with Port-Royal.

Between 1667 and 1677 he wrote his tragedies *Andromaque*, *Britannicus*, *Bérénice*, *Bajazet*, *Mithridate*, *Iphigénie*, and *Phèdre*, together with a comedy, *Les Plai-deurs* (a satire on the law), which was only a qualified success. By this time he was troubled with growing doubts concerning the stage; and after reconciliation with the Jansenists he abruptly severed his connexion with it. He then married and was appointed, jointly with Boileau, historian to the king. His only remaining plays were two of a religious character written between 1689 and 1691 at the request of Madame de Maintenon for performance by the ladies of St. Cyr—*Esther* and *Athalie*, which rank with his best works. Thereafter he published only four *Cantiques Spirituels* and a history of Port-Royal. He died April 21, 1699, and was buried at Port-Royal.

The French regard Racine as "le classique par excellence," and as one of the chief glories of their literature; and if it is impossible for English readers to share their enthusiasm, they can at least recognize his pre-eminence within his own chosen and restricted field. Far inferior to Corneille in poetic and dramatic power, he was his superior in art; the severe restraints of the classic form of drama seemed rather to help than to check his genius; and unlike Corneille, whose inequalities are flagrant, he keeps to a uniform level of excellence. With him incident as such has no importance; he uses it only as an initial force in the emotional crisis which is always his central theme; and the interest of his tragedies is purely psychological. While as a result his plays are composed only of endless talk and discussion, his skill as an analyst of passion, and especially of love, is remarkable; while the beauty of his versification deserves the highest praise. *Consult Racine et Shakespeare*, M. H. Beyle, 1854; *Racine*, G. Larroumet, 1898; *Jean Racine*, A. F. B. Clark, 1940. *Prose*, Rasseen.

Racine, LOUIS (1692–1763). French poet. He was born in Paris, Nov. 6, 1692, the younger son of Jean Racine, and, rendered independent

by marriage to a wealthy wife, devoted his life to religion and literature. His didactic poems, *La Grâce* and *La Religion*, were inspired by his Jansenist faith, and are more remarkable for their piety than for their poetic qualities. His complete works, 6 vols., were published in 1808. He compiled a *Life* of his father which was published in 1747, and translated *Paradise Lost* into French prose. He died Jan. 29, 1763.

Rack (Middle Dutch *recken*, to stretch). In machinery, a toothed bar for transmitting motion from or to gear wheels. It may be considered a portion of the pitch circle of a gear wheel of infinite diameter—a straight line. In combination with a pinion the device is used to produce motion of translation from a rotating gear wheel. Examples are the rack-and-pinion focusing arrangement for cameras and microscopes: turning the pinion causes the rack (and any part to which it is fixed) to advance and return in a straight line. In many printing machines the carriage, or table carrying the printing plates, is given a reciprocal motion beneath the cylinders by means of racks. A rack-railway, on steep inclines, has a cogged rail between two bearing rails; a driven pinion beneath the engine framework engages with the rack and pulls the engine up the incline. (*See Gear*.) The name rack is also given to a framework with bars on which articles can be stacked, as the domestic plate-rack; or to a similar framework with shelves on which articles can be placed.

Rack. Former instrument of torture. It consisted of an oblong frame of wood on which the victim was stretched and his limbs secured by ropes which could be gradually tightened by pulleys or other devices, till the victim confessed under the stress of pain or had his limbs dislocated.

Rack. One form of the instrument of torture used in England from the 15th to the 17th century

The rack was known to the Egyptians and Romans. It was extensively used for the torture of Christians to force them to abjure their faith, and in England from the 15th century. At its greatest vogue during the reigns of Henry VIII and Elizabeth, its legality was challenged by the judges in 1628, over the attempted racking of John Felton, the murderer of the duke of Buckingham, and it rapidly fell into disuse.

Rackets or **Racquets**. Ball game played on an asphalted court, 60 ft. by 30 ft. in area, enclosed by four walls. The front and side walls are generally about 30 ft., and the back wall 15 ft., in height. A strip of board 26 ins. in height is carried along the bottom of the front wall, forming the playing line,

Rackets. The hand-in serving from the service box. Above, plan of the court

while a painted line, 9 ft. 6 ins. from the floor level, indicates the service line.

On the floor of the court, at a distance of 38 ft. from the front wall, a similar line is painted across the floor from side wall to side wall, called the short line. From the middle of this line extending to the centre of the back wall another line divides the space into two halves, termed the fault line. Just above the short line, in the angles formed by it and the side walls, are two spaces 8 ft. square, designated service boxes. The game is played by two or four players, one against one (singles), or two against two (doubles).

The racket consists of a wooden hoop 7 ins. in diameter, strung as tightly as possible with catgut, with a handle about 30 ins. long. The ball is composed of strips of cloth very tightly bound together with twine and covered with white kid, one inch in diameter and one ounce in weight. The server (or hand-in) stands in one of the service boxes, striking the ball on to the front wall above the service line in such a manner as to cause it to drop, either with or without hitting one of the other walls, behind the short line on the opposite side of the court. The opponent (or hand-out) who awaits the ball behind the short line must return it before it touches the floor twice. and the ball must strike the front wall above the board denoting the playing line, in the return. From this point of the game the server's business is to return the ball in a similar manner; this continuing until one or the other makes a fault. The game consists of 15 points or aces.

There are several English championships in connexion with rackets: the open championship (singles) for all classes, established in 1820; and the amateur singles championship, dating from 1888, being the most important. The governing body is the Tennis, Rackets and Fives Association, founded in 1907. *See Fives; Pelota; Squash Rackets.*

Rackham, ARTHUR (1867-1939). British artist. Born Sept. 19, 1867, he studied at Lambeth school of art, and became well-known as an illustrator of books, including editions of Peter Pan, 1906; Alice in Wonderland, 1907; A Midsummer Night's Dream, 1908; Wagner's Ring librettos, 1910-11; Grimms' and Hans Andersen's fairy tales; Comus, 1921; and The King of the Golden River, 1932. His most satisfying work was in a combination of pen line and colour wash, and the style was extremely personal, having something of the Gothic flavour. The elves, gnomes, and sprites which adorned his drawings recalled the gentler aspect of medieval gargoyles. He died Sept. 6, 1939.

Racking. In metallurgy, the first or an early stage in the treatment of ores and coal. The ore is thrown on to an inclined rack of stout iron bars, upon which it is washed with water to remove adherent clayey or other worthless rock. *See Mining.*

Rack Rent. Term applied to a rent which is equal, or nearly

equal, to the annual value of the land or tenement. In the Public Health Act, 1936, it is defined as a rent not less than two-thirds of the rent at which a property might be let from year to year free from the usual tenant's rates and taxes, and tithe rent charge, and deducting therefrom repairs, insurance, and other expenses. The term was formerly used in popular parlance to signify excessive rent. *See Rent.*

Racoon. Small carnivorous mammal, related to the bears. Racoons are confined to America,

Racoon. Common variety of this nocturnal animal of N. America

and include two or perhaps three species. The common racoon (*Procyon lotor*) is about 24 ins. long in body, with a tail about 10 ins. in length. It is a stoutly built and heavy animal, covered with thick greyish-brown fur, the tail being ringed with black; but it varies much in size and colour.

It occurs in N. America, but is rarely seen by day. It makes its home in holes high up in the trees, only coming down at night in search of food; it feeds upon small birds and mammals, fish and freshwater mussels, and occasionally varies its diet with young corn and fruit. In the colder districts it hibernates during the winter, but remains active in the more S. regions. Its fur is valued in the trade, and it is vigorously hunted and trapped, with the result that it is no longer numerous in many districts. In S. America the crab-eating racoon occurs. *See Coati.*

Racziewicz, WLADYSLAW (1885-1947). Polish statesman. Son of a lawyer, he was educated at Dorpat (Tartu) university. In the First Great War he was a conscript in the Russian army, and later became chief administrator of the Polish eastern provinces. He was speaker of the Polish senate shortly before the Second Great War, and after Mosicki's resignation in Sept., 1939, president of Poland, forming the first Polish government in exile (at Angers, France), under Sikorski. In 1940 he went to

Great Britain, where he helped to develop the Polish forces. Opposed to the Polish government of Lublin, 1945, he remained at the head of his government until Great Britain and the U.S.A. recognized the reconstituted Polish government at Warsaw. He died June 6, 1947.

Raczynski, EDWARD, COUNT (b. 1891). Polish diplomatist. Born Dec. 19, 1891, he was educated at Cracow and Leipzig universities, and entered the Polish ministry of Foreign Affairs

in 1919, serving in Warsaw, London, and Copenhagen. Accredited to the League of Nations during 1932-34, he was Polish ambassador to London during 1934-45. He was appointed acting minister for Foreign Affairs under Sikorski in the government in exile in London, then became chief representative of a committee on Polish-British financial transactions 1945-47; and later was given the post of adviser on Polish affairs to the British ministry of Labour.

RADAR: LOCATION OF OBJECTS BY RADIO

R. W. Hallows, M.I.R.E., Author of Radar: Radiolocation Simply Explained

Here is an account of the origins and methods of locating invisible objects, as developed, principally in the U.K., before, during, and after the Second Great War. See also Appleton Layer; Cathode Ray Tube; Magnetron Valve; Radio, etc.

Radar is the name given to a system of locating objects, whether stationary or in motion, on land, in or on the sea, or in the air, by means of pulses of radio waves. A pulse emitted by the transmitter strikes the target and is reflected back from it to a receiver placed near the transmitter. The range is determined by timing the out-and-home journey of the pulse. The bearing is found by measuring the azimuth angle from due north at which the pulse returns. To locate an airborne target, its height is also required. This is obtained, automatically or by calculation, from the measured vertical angle of the return path.

The basic principle of radar—the fact that very short radio waves can be reflected—was generally known in the early 1920s. Sir Edward Appleton suggested in 1923 that the height of the upper reflecting layer in the atmosphere (the Appleton or F layer) might be determined by "shooting" short-wave radio pulses vertically upwards and timing the interval between their transmission and their return as echoes. Within a few years this method was in regular daily use at observatories in many parts of the world. Meanwhile communications engineers and radio amateurs had observed and reported that interference with shortwave radio signals might be caused by reflections from passing aircraft; and in many countries men had realized that apparatus might be contrived to give early warning of the approach of aircraft.

But it is a long step from the knowledge of a principle to the production of practical apparatus.

The U.S.A., Germany, France, and perhaps some other countries had a few clumsy, complicated, and not very accurate radar sets when the Second Great War broke out in Sept., 1939. Great Britain alone had a complete and highly developed radar system of proved reliability. In 1935, Sir Robert Watson-Watt demonstrated to the authorities that such an apparatus was possible, and it was decided to concentrate every effort on developing it as a form of defence. By the autumn of 1935 the first radar station in the world was working regularly in the U.K. It could detect aeroplanes up to a range of 50 m. By 1938 the range had been increased to 150 m. and the erection of a complete chain of coastal stations was under way. Nearly completed when the war started, this chain was then rapidly finished. It was soon followed by the building of a second chain, designed to detect low-flying aircraft. The existence of these two chains, and of the radar apparatus which had been developed for use with A.A. guns, was a substantial contribution to the winning of the battle of Britain, the key battle of the war. In no other way could the few fighter aeroplanes and the few A.A. guns available have dealt with the bombers of the German Luftwaffe. Thanks to radar, fighter planes and their pilots could be kept on the ground until they were needed; when an attack came they could be sent where most effective.

Radio waves are simply a particular section of the whole range of electro-magnetic waves, which also includes light waves. If, on

entering a room at night, a man switches on the electric light and sees a chair, he accepts this as normal. The eye is a specialised detector of visible light waves. Rays from the electric light filament strike the chair and are reflected back to the observer's eye, which thereupon registers the impression "chair." A wireless receiving set contains a detector of certain electro-magnetic waves, far longer than light waves, to which the eye cannot respond.

An object, then, may be "illuminated" by various kinds of electro-magnetic waves, but only the appropriate specialised detector can respond to the waves of the particular kind that are reflected from it. The radar set "sees" its target because (1) the radar transmitter bathes the target in an illumination by radio waves; (2) this illumination gives rise to reflection of the same wavelength; (3) the radar receiver responds to such waves. As the very short radio waves used in radar are unaffected by darkness, thick smoke, fog, mist, rain, or falling snow, radar can see when the eye is blind.

The Echo Basis

The measurement of distance or range by radar is based on the echo principle. From the known velocity of sound at sea level, an observer can calculate the distance of a vertical cliff from the point at which he is standing by noting with the help of a stopwatch the time it takes for a short, sharp shout to reach the cliff and its echo to return to him.

A pulse in the radio sense is a short, sharp burst of radiation, rising rapidly from zero to maximum intensity, enduring only a short time, and fading to zero intensity as rapidly as it rose. The range cannot be measured unless the interval between one pulse and the next is long enough for the "echo" of one to be received before the next starts. The number of pulses per sec. is called the recurrence frequency and depends on the maximum range to be measured. The longer the range, the longer the travel time, and the lower must be the recurrence frequency. Radio waves travel about a million times as fast as sound waves. Their speed varies very slightly as they travel through the emptiness of outer space or the various layers of the earth's atmosphere; but for all practical purposes their constant velocity can be taken as 186,200 m., or 300,000,000 metres, a sec.,

or 1,000 yds. in 3.05 millionths of a sec. As the pulse and its echo cover each 1,000 yds. in reaching and coming back from a target 1,000 yds. away, every 6.1 millionths of a second—3.1 micro-seconds—registered on the stopwatch of the radar receiver equals 1,000 yds. of range.

A radar transmitter sends its pulse towards the target and at the same instant delivers a synchronising, or locking, pulse direct to the radar receiver. This pulse triggers off the range line-base and starts the spot of a cathode ray on its journey across the screen. When the time-base is properly adjusted, the distance travelled at any instant by the spot is a measure of the time that has elapsed since it started to move. If the instrument is so arranged that the spot performs a complete traverse of the screen in 305 micro-seconds, and the echo returns to the receiver when the spot has made one-tenth of its journey, the time it has taken is 30.5 micro-seconds, and since 6.1 micro-seconds represents 1,000 yds. of range the range in this case

Radar, Fig. 1. The return of the echo causes a negative potential to be applied to the X_2 plate, with the result that the spot is flicked upwards and a break is formed

must be 5,000 yds. A simple and effective method of recording the arrival of the echo is shown in Fig. 1. The time base runs between the X-plates of the tube, the spot taking 305 micro-seconds to make its traverse, then flashing back and not restarting until the next outgoing pulse triggers it off. The echo pulse as it returns is applied as a "whiff" of negative potential to the Y_2 plate. The effect of this is to move upwards for an instant the beam of electrons which gives rise to the spot. When the echo pulse comes to an end (as it does in from one to three micro-seconds) the spot resumes its normal path. Thus the arrival of the echo forms a break or "blip" in the track. By means of ingenious electrical and mechanical devices the time can be measured to a fraction of one millionth of a second, and the range to within less than 25 yds. by operators after a comparatively short period of training.

Most of the radar sets in use in 1939 and 1940 worked on wavelengths measured in metres. The wavelengths of those used by A.A.

artillery were between $3\frac{1}{2}$ and $5\frac{1}{2}$ metres (84 and 55 Mc/s). The radar apparatus used for directing searchlights worked on one of the shortest wavelengths then in general use: $1\frac{1}{2}$ metres (201 Mc/s). Ranges could be measured accurately by means of these comparatively long wavelengths, but real precision in the measurement of azimuth and vertical angles (without which the direction of approach of, e.g., an aircraft cannot be ascertained) required that the radiation from the transmitter should be focused into a narrow beam. The British searchlight control radar (S.L.C.) and German sets installed in 1942 were partially successful in achieving this; but complete success could be achieved only if some means could be found of transmitting powerful pulses on wave-lengths of the order of 10 cms. (3,000 Mc/s) or less.

British Development

The only type of valve then known which could generate oscillations of such wavelength was the American Klystron, but this was of no use for long-range radar because its maximum power output was very small. In 1940 two British scientists, Boot and Randall, conceived the idea of an entirely new type of valve-generator, the cavity magnetron, which could operate effectively at very high frequencies. The magnetron was developed in both the U.K. and the U.S.A., for full particulars of it were sent to that country under lease-lend.

A radar transmitter could now send out powerful pulses on a wavelength measured in cms., or even fractions of a cm. Like those of light, such waves can be sharply focused into beams by means of parabolic reflectors or lens systems of sizes small enough to make their use practicable in naval, military, and air force equipment. With the best of apparatus using wave-lengths of the order of metres the measurement of azimuth and elevation angles had always a possible error of at least $\frac{1}{4}^\circ$; the first microwave radar apparatus reduced the possible error to less than 10 mins. of angle.

Radar measures the slant range—that is, the range along the line of sight to the target. An aircraft's position at any moment, however, on a flat map is vertically below its air position. As Fig. 2 shows, the aircraft would be plotted too far away if the radar angle of elevation erred on the low side and too close if the measurement had more than its true value. With

the transmitted pulses going out on a narrow beam of very short waves and with a similar focusing system applied to the aerials of the radar receiver, very close angular

Radar, Fig. 2. A, air position of target. Correct measurement of the angle of elevation enables its true position to be plotted on the map at A' . The slant ranges to B and B' are the same as that to A. At B the angle measurement errs on the low side and the target is plotted, B' , at too great a range on the map. If the error is on the high side, the target is plotted on the map at too short a range (B'')

measurements are obtainable. To bring such measurements within the powers of the ordinary operator the English physicist Butevant invented the system of "split," which was applied to almost all precision radar equipment. The principle of split is illustrated in Fig. 3. The aerials needed for the transmission and reception of 10 cm. waves are about two ins. long, for shorter wavelengths (higher frequencies) they are still smaller. Such an aerial can be placed, like the bulb of a motor car headlamp at the focal point of a parabolic reflector, which focuses the radiation from it, if it is a transmitting aerial, into a narrow beam, and similarly focuses, so to speak, the directions from which it can pick up radiation, if it is a receiving aerial. The aerials are made to rotate with a slight eccentric movement; the beam into which the radiation is focused is thus made to revolve round and round an imaginary straight line which represents the direction in which the radar set is "looking."

For the measurement of bearing the receiving set is automatically switched in for an instant whenever the aerial is at "9 o'clock" or "3 o'clock," the target being regarded as at the centre of a clock face. For the measurement of angle of elevation, switching-in occurs at "12 o'clock" and "6 o'clock." The signals received in the "9 o'clock" and "3 o'clock" positions are applied to the bearing cathode ray tube, those at the "12 o'clock" and "6 o'clock" posi-

tions to the elevation cathode ray tube. Both tubes are used in exactly the same way, hence it will be sufficient to consider the events in one of them, that used for bearing measurement.

In Fig. 3A the distance from the original O to the circumference of the polar diagram of a receiving aerial is a measure of the relative magnitude of its response to signals reaching it from any direction. The response is equal in the "9 o'clock" and "3 o'clock" positions if the aerial is pointing as much to the left of the target in the former as it is to the right in the latter (Fig. 3B); this happens when the radar set is directed straight at the target. If the radar set is pointing to the right of the true position of the target, a stronger signal will be received (Fig. 3C) from the "9 o'clock" than from the "3 o'clock" echo. Should the set be to the left of the target, the "3

When the left break is higher than the right (Fig. 4B) the equipment is "off target to the right;" when the right break is higher (Fig. 4C) the equipment is "off target to

Radar. Fig. 4. Indications on the screen of the bearing tube. A, "On target"; B, "Off target to right"; C, "Off target to left".

the left." Fig. 4A, 4B, and 4C correspond to Fig. 3B, 3C, and 3D respectively.

The indications from the target on the bearing (and angle) tube are thus split into two separate breaks. The operator is not concerned with degrees or minutes of angle; all that he or she is called upon to do is to ensure by turning a handle that the breaks on the trace of the tube are maintained at an equal height. Ingenious devices then make precise measurements of the angle and transmit them as a continuous stream

Radar. Fig. 3. Illustrating one method of measuring bearing. A, Polar diagram of radar receiving aerial. The length of the straight lines radiating from O is a measure of the relative strength of signals received from the directions OA, OB, OC, etc. B, "On target": signals are received at the same strength in the 9 o'clock and 3 o'clock positions of the rotating aerial; C, "Off target to right": the 9 o'clock position gives a stronger signal than the 3 o'clock; D, "Off target to left": the 9 o'clock signal is weaker than the 3 o'clock.

o'clock" echo will give the stronger signal (Fig. 3D).

The automatic switching system of the receiver performs a second duty. At the instant when the negative voltage resulting from the "3 o'clock" echo is applied to the Y2 plate of the cathode ray tube it causes a momentary "whiff" of extra positive potential to be applied to the X2 plate, with the result that the corresponding break is displaced to the right. Two breaks are thus side by side on the bearing cathode ray tube; the left-hand one is due to the "9 o'clock" echo, the other to the "3 o'clock" echo. If the breaks are of equal height (Fig. 4A) the two signals are of equal intensity and the equipment is "on target."

proached with the idea of such a system was, "It stinks.") H_2S and other radar systems use what are called P.P.I. (Plan Position Indicator) tubes.

In such a tube (Fig. 5) the time base trace starts from the centre of the screen and extends outwards towards its edge, Oa. The trace revolves round the centre O in synchronism with a rotating aerial, occupying successively the positions Oa, Ob, Oc, Od, and so on. As the screen has a long afterglow, a picture is "painted" on it in this way

Radar. Fig. 5. The principle of the P.P.I. tube. The time base trace runs from the centre of the tube to the circumference. The whole trace is made to revolve, like the spokes of a wheel, in synchronism with a rotating aerial, occupying successively the positions Oa, Ob, Oc, Od, and so on. As the screen has a long afterglow, a picture is "painted" on it in this way

the positions Oa, Ob, Oc, Od, etc. The screen of the P.P.I. tube is coated with a special kind of fluorescent material which has a long afterglow, so that any part of the screen which has been made to glow by the impact of a dense stream of electrons continues to glow for rather longer than the time needed for the trace to make a complete revolution about the centre.

Fig. 6 indicates how the beam from the revolving aerial is made to sweep over the ground below. Water sends back no echoes; fairly strong ones are returned by the surface of flat land; stronger ones still by high ground, buildings, and some other features. Strong echoes also return from ships on the surface of water. The echo pulses are applied to the grid of the P.P.I. tube in the form of positive voltages with values corresponding to the strength of the

Radar. Fig. 6. Showing diagrammatically how the rotating H_2S beam sweeps over an area of ground

of information to the place where it is required.

A type of radar equipment, A.I. (Aircraft Interception), was invented so small and light that it could be carried in a fighter plane, the pilot of which was thus enabled to "see" at a considerable distance the moving bomber that was his target. The system called " H_2S " was developed to make it possible for aeroplanes to spot submarines and other seacraft, and later to provide the navigator of a bomber with a fairly clear picture of the ground below him. (The name " H_2S ," symbol for sulphuretted hydrogen, is said to have been given this type of radar because the response of one of those engaged in radar research when ap-

echoes. If there is no echo, the electron beam remains cut off and there is no fluorescence of the screen; a very strong echo permits a dense beam to strike the screen and so produces a brilliant white point on it; echoes of intermediate strengths give rise to corresponding degrees of illumination. As the time base revolves, a picture of the main features of the land and water below is built up on the screen. The picture remained rather a rough one at the end of the Second Great War; but the use of shorter waves and of a time base revolving at high speed must eventually lead to radar television with a picture on the P.P.I. tube almost as clear, detailed, and accurate as that on the ground glass focusing screen of a camera. A form of H_2S provides one of the most useful navigational services for peacetime flying, for it enables the navigator to "see" in any kind of weather what is below him and ahead of him on the surface of the ground. Similar gear is installed in great ocean liners and many other ships, making navigation safe in darkness, falling snow, or fog, in island-studded or rocky channels, and in narrow waters where there is heavy traffic.

Radar Beacons

Both air and sea navigational systems make much use of radar beacons. Their basic principle was developed from that of a wartime device called I.F.F.—Identification, Friend or Foe. Friendly aircraft carried a very small radar transmitter yoked to a compact receiver of a special kind. Normally the transmitter was quiescent; but when the train of pulses from a ground radar set reached the receiver it brought the transmitter into action. The transmitter sent out a pre-arranged train of pulses, forming a code recognition signal. A very slight delay was introduced between receiver and transmitter; the I.F.F. pulses were therefore received by the ground station a little after the radar echo pulses. They thus appeared on the screen close to, but a little behind, the target which they identified as friendly. One of the best-known wartime beacon systems was "Rebecca-Eureka." Rebecca was a pulse transmitter carried by aircraft; Eureka was a portable beacon dropped with parachute troops and set up by them at a particular point. By "homing on" to Eureka, following aircraft could drop supplies, ammunition, or reinforcements where they were needed. Fixed

beacons of the Eureka type are used as navigational and landing aids for passenger and freight aircraft. Similar beacons installed at the entrances to harbours, marking danger points or indicating deep-water channels, help to guide shipping.

Radar. Fig. 7. Map-making by radar. On the first run the plane flies at a height of, say, 20,000 ft. and at 45,000 yds. from the radar beacon. The automatic camera thus makes exposures covering the country lying on an arc of a circle of which the radar beacon is the centre. The second, third, and succeeding runs are made at the same height, but at progressively shorter ranges. In this way a detailed photographic picture is built up of the whole segment ABC

Vast tracts of almost unexplored land in, e.g., Africa have been accurately mapped with the aid of radar beacons. Fig. 7 indicates how this is done. A plane fitted with automatic cameras, which photograph the ground below every few seconds, flies at a fixed height and at a fixed distance from the beacon. The photographs made during a run cover an area of ground which is the arc of a circle of which the beacon is the centre. The next run, flown at the same height, may be at rather shorter range, so that the photographs are of another arc, parallel to the first and just overlapping it. In this way an accurate picture of the whole surface is obtained, from which a good map can be made.

Rebecca and Eureka have a special peacetime use in the refuelling of air liners in flight. Both Rebecca and Eureka are airborne, and the liner and the tanker aeroplane "home on" to one another in the neighbourhood of a chosen rendezvous. The petrol hose trailed by the tanker is then caught by the liner, the fuel transferred, and the hose cast off.

Since the pulses that they send out are not echoes, beacons are not radar devices in the strict sense of the word. As, however,

so many radar principles are involved in their working, they are always included in the radar category; there are other important navigational devices, all classed as radar, which do not make use of either echoes or pulses sent by a triggered transmitter. One system makes no use of echoes, triggering, or pulses. But they were developed by those engaged in radar research, and much of the necessary apparatus is founded on radar technique. All these semi-radar equipments use the principle of hyperbolic navigation. Suppose that there are two ground stations, A and B in Fig. 8, whose working is interlocked so that B always transmits a pulse 500 micro-seconds after A has done so. So long as X, the aeroplane or ship using hyperbolic navigation, is at exactly the same distance from A and B it will always receive the B pulses 500 micro-seconds after the A pulses. The only possible positions of X at which it is equidistant from A and B, and at which the B pulses are received 500 micro-seconds after the A pulses, lie on the straight line OPQ. This form of radar is concerned with a single, not a double, journey of the wireless waves; hence the time taken to cover 1,000 yds. of

Radar. Fig. 8. Illustrating the basic principle of hyperbolic navigation. See text

range is 3.05 micro-seconds. Suppose that the distance from X to B is 100,000 yds. less than to A. The A pulses take 305 micro-seconds more to reach X than those from B, and the delay due to the shorter path of the B pulses becomes $500 - 305 = 195$ micro-seconds. All the possible positions of X at which the delay is reduced to 195 micro-seconds lie on a curve such as RP_VS , which is a hyperbola. Similarly, if X is nearer by 100,000 yards to A than to B, the delay will be increased

by 305 micro-seconds, and the position of X will be somewhere on the hyperbola $TP_{II}U$. Other differences in range between X and A and B are indicated by hyperbolae such as $VP_{IV}W$ and $YP_{III}Z$. Hyperbolae corresponding to other range differences are shown at $JP_{VI}K$ and $LP_{I}M$.

The introduction of a third transmitter (C, Fig. 9), also interlocked with A and B, makes it possible to fix the exact position of X. From the delays between the A and B pulses the operator on board X knows that he is somewhere on the hyperbola DE; from the A-C delays, he finds that he is somewhere on FG. He can now fix his position at Z where DE and FG intersect. On the navigator's

Radar. Fig. 9. By the use of a third station, the navigator is enabled to fix his position, Z, at the intersection of two hyperbolae. See text

chart the curves of the two sets of hyperbolae represent much smaller time (and therefore range) differences than these suggested; they form a fine lattice over its surface, A-B curves being coloured differently from A-C curves. The navigator using any of the hyperbolic systems, such as Gee (British shortwave, medium range equipment), Loran (U.S. long wave, long-range equipment), or Decca (British very long wave, medium-range equipment), can fix his position very closely at any instant. The Decca apparatus has an indicator on which the numbers of the lattice lines forming the "fix" are shown in figures like those of a motor car speedometer. Formerly the ships bringing coal to London's gasworks from northern ports were sometimes held up for days by coastal fog. Fitted with this navigational equipment, they can sail in any weather except the most violent storms.

Radar is used in the "blind landing" equipment of aircraft and airports. In thick weather an incoming aeroplane, located by one type of radar, can be directed to circle in a safe area until its turn comes. It can then be directed into the landing beam, which guides it on to the runway. With systems such as the "talk you down" the pilot can place himself

entirely in the hands of the controller on the ground, doing nothing except obey the orders he receives. The controller, knowing from instant to instant the exact height, speed, and position of the unseen aeroplane, can give the pilot directions which ensure a safe landing.

Radar has been found of considerable use in meteorology, since with its help cold fronts and violent storms can be detected and located. The exact height of clouds can also be measured by radar. Radar echoes have been received from the moon; and radar may provide a means of measuring accurately the distances of some of the other nearer heavenly bodies. Meteors are regularly recorded and counted by radar. The echoes come not from the meteors themselves, which are generally far too small to produce sufficiently powerful reflections of radio waves, but from the long trail of ionised air which each leaves in its wake as it passes through the earth's upper atmosphere. Radar observation has made it possible to record the occurrence of meteors in the daytime when their light is too feeble to be detected by the human eye.

Radautz. Town of S. Bukovina, Rumania. Situated 32 m. E.S.E. of Cernauti, close to the Prut and the frontier of the U.S.S.R., it has manufactures of machinery, paper, and leather, and has been noted for horse breeding. Pop. est. 17,000.

Radbertus. Medieval theologian. Born about 800, he became a monk at Corbie, in N. France, and there he passed his life in teaching and study. He was for a few years abbot of the house, and he died about 860. Radbertus made a reputation as a theologian by his work *On the Body and Blood of Our Lord*, one of the earliest works on the subject of transubstantiation.

Radcliffe. Municipal borough and market town of Lancashire, England. It stands on the Irwell, 7 m. by rly. N.W. of Manchester. The buildings include the old church of S. Mary, dating from the 13th century and restored in the 19th. The industries include the making of cotton, paper, and chemicals; dyeing and bleaching; engineering and iron-founding. Radcliffe votes with Bury. Market days, Tues. and Fri. Pop. 27,500.

Radcliffe, ANN (1764-1823). British novelist. Born in London, July 9, 1764, the daughter of William Ward, in 1787 she married William Radcliffe, afterwards pro-

prietor of *The English Chronicle*. In her stories the influence of certain aspects of the prevailing romantic movement is marked. Her fame rests chiefly on *The Mysteries of Udolpho*, 1794, which enjoyed great contemporary vogue. *The Italian*, or the Confessional of the Black Penitents, 1797, was received with equal enthusiasm. She died Feb. 7, 1823. In handling the mysterious and supernatural in such a way as to keep the reader's attention at fever pitch until the dénouement, when the supernatural is explained away, Ann Radcliffe has scarcely a superior. She excels in description of scenery, but her characterisation is weak.

Radcliffe, JOHN (1650-1714).

English physician. Born at Wakefield, he was educated at Univer-

sity College, Oxford, taking a degree in medicine. In Oxford and then in London he made a reputation as a physician, and became medi-

John Radcliffe
After Kneller

cal attendant to William III, Mary, and Anne. He was a member of parliament, and died at Carshalton, Nov. 1, 1714. Radcliffe is known as a benefactor to Oxford, as with money bequeathed by him were built the library, observatory, and infirmary that bear his name, which is also perpetuated by travelling fellowships for students of medicine.

Radcliffe Infirmary. Hospital in Oxford, built 1752-70, from funds bequeathed by John Radcliffe (v.s.). In 1940-41 it became famous for the startling results of the penicillin (q.v.) experiments carried out there.

Radcliffe Library. Building in Oxford, also known as the Radcliffe Camera. It was erected 1737-49, by John Gibbs, with £40,000 bequeathed by John Radcliffe (v.s.), who also left money to remunerate a librarian. At one time known as the Physic Library, in 1860 it was lent to the university as a reading room for the Bodleian (q.v.). It is a large, domed, circular building, 100 ft. in diameter, and stands in Radcliffe sq., behind the church of S. Mary the Virgin. The dome is conspicuous in the city. See frontispiece to vol. 1.

Radcliffe Observatory. Astronomical observatory formerly at Oxford, now at Pretoria. It was founded in 1771 with funds

provided under the bequest of John Radcliffe, and built during 1772-95. Its observations were first published in 1839. The site was sold in 1929 and the proceeds used to erect in 1935 a 74-in. telescope at Pretoria, S. Africa. The main mirror was added in 1948, the nucleus of a new observatory thus being formed.

Radegunde (d. 587). Frankish saint and queen. The daughter of a pagan German prince she was captured by and married the Frankish king, Clotaire, about 530, having become a Christian. By her piety she won considerable renown. In consequence of a feud between her husband and her kinsfolk, she left Clotaire and became a nun, founding a religious house at Poitiers. She died Aug. 13, 587. Canonised, she has a festival on Aug. 13.

Radetzky, JOHANN JOSEF, COUNT (1766-1858). Austrian soldier. Born in Bohemia, he served against the Turks in 1788-89, and in the wars against Napoleon, at Mar-engo, Wagram, and Leipzig. Remarkable for bravery and popularity, he was made marshal in 1836, and at 82 he was commander-in-chief in Lombardy when the revolt broke out there in 1848. Though at first hard pressed, he eventually defeated Charles Albert of Sardinia at Custoza, July 25, and in the following year secured a victory at Novara, March 23, and besieged and took Venice. He was governor of Lombardy till 1857, and died Jan. 5, 1858.

Radhanpur. Town and former state of India, now in the Saurashtra union. It lies between Baroda and the Rann of Cutch, and is drained by intermittent streams, rising in Mt. Abu. The town lies 150 m. N.W. of Baroda. There is some local trade in wheat, grain, cotton, rice, and sugar. Area 2,016 sq. m. Pop., state, 100,644; town, 13,400.

Radial Artery. Artery running from immediately below the bend of the elbow to the outer side of the palm of the hand. Just before crossing over the wrist it can be felt beating beneath the skin, forming there the well-known pulse.

Radial Engine. Air-cooled four-stroke petrol engine. It suits aircraft on account of its accessibility, large exposed cooling surface, and ease of replacement. It has good balance and freedom from torsional vibration. Single-row, two-row, and even three-row radials are common. In the single-row, there are usually 5, 7, or 9 cylinders, with a single crank (Fig.

1). The cylinders are attached to a fixed frame and the crank rotates. The big end of one connecting rod,

Radial Engine. Fig. 1. 7-cylinder engine spaced round a single crank

known as the master rod, is joined to the crankpin; the ends of the remaining rods are pinned to lugs

Radial Engine. Fig. 2. How the rods are pinned to lugs on the master rod

on the master rod (Fig. 2). These pins transmit the same load to the crank as the main rod, but a smaller bearing surface is permissible because the angular movement relative to the main rod is comparatively small.

In earlier engines fitted with overhead valves, multi-lobed cams, revolving slowly, operated the inlet and exhaust valves through push-rods. Armstrong-Siddeley and the Bristol Aeroplane Co. achieved notable successes with this type. Some engines of high power are operated by sleeve

valves (*q.v.*), first introduced and developed for aircraft by the Bristol Aeroplane Co. These give quieter running, simplify construction, permit the use of much higher mean pressures in the cylinders, and reduce maintenance difficulties. Damage to the working surfaces does not involve the replacement of a cylinder, only of the valve.

Fig. 3 is a front view of the Bristol Perseus engine, showing the inlet and exhaust ports of each cylinder, these being opened and closed by the internal sleeve valve. This engine developed over 1,000 b.h.p. at 2,700 r.p.m. The Bristol Hercules and Centaurus have two rows of cylinders, the rear row being staggered in relation to the front row in order to permit free flow of air over both. The Centaurus is supercharged to develop a maximum b.h.p. of over 2,000.

Radial Nerve.

One of the terminal branches of the musculo-spiral nerve (*q.v.*). It is the nerve of sensation to the back of the lower third of the forearm and the back of the thumb, the index and middle fingers, and the outer side of the ring finger.

Radial Velocity.

In astrophysics, the speed of motion of a heavenly body towards or away from the observer. It is measured spectroscopically by means of the

Radial Engine. Fig. 3. Front view of a Bristol Perseus engine, showing inlet and exhaust ports

Doppler (*q.v.*) effect, which shifts the spectrum lines towards the red if the radial velocity is positive (recession) or towards the violet if it is negative (approach). Speeds higher than about 1 m. a second can be measured, and stars travelling ten times as fast as this are common. By combining the radial velocity with the proper motion (*q.v.*), the true speed and direction of motion of the star can be found.

Radian. A unit of angular measure. One radian is the angle subtended at the centre of a circle by an arc equal in length to the radius. It equals 57.2958° .

Radiation. The emission by material bodies of energy in the form of electromagnetic waves. These are similar in character to those used for radio transmissions but differ widely in wavelength. The electromagnetic theory has been modified during the 20th century by the ideas which have arisen from new conceptions of the atom and of the release of its energies by dislocations and recombinations; according to the views enunciated by Planck (*q.v.*), radiant energy is given out in minute pulses. Experiments indicate that radiant energy has a dual characteristic, in some cases behaving as Planck stated, but in others adhering to the older idea of transverse waves. Radiant energy may be explained from the example of a hot body surrounded by a gas. Heat is lost by conduction through the gas (*e.g.* air) or by convection currents set up in it, both processes being dependent upon the presence of material particles in the air. On the other hand, should the body be suspended in a vacuum, energy will be radiated from the body to the walls of the vessel. The net effect of the radiation depends upon the nature and temp. of the body and the walls of the vessel involved in this exchange of energy, *e.g.* a fall in the temp. of the former will result if it radiates energy faster than it absorbs it. According to the theory of exchanges, all solids give out radiant heat within a range of wavelengths dependent upon their temps., and when a solid is hotter than its surroundings it gives out more heat than it receives. A good absorber is also a good radiator, and while a white or highly polished metal surface absorbs little energy a dull black surface, at the same temperature, is much more efficient. If solids are heated to red or even white heat, different amounts of energy will be emitted; further, the solid which is black at ordinary

temps. gives out the most radiation at the higher temps. Hence the ideal substance which, at any temp., will emit the maximum possible amount of radiant energy in all wavelengths is termed a perfect or "black-body" radiator.

Stefan's law states that with a perfect black body the intensity of radiation emitted is proportional to the fourth power of the absolute temperature of the surface. Also, from a graph where the distribution of energy over the wave-band, for a perfect radiator at a given temperature, is shown by plotting the energy as ordinate and wavelength as abscissa, the relationship of energy to wavelength can be obtained for any other temp. by varying the abscissa scale inversely as the fourth power and the ordinate scale inversely as the fifth power of the absolute temperature.

The Sun's Radiation

The most important and familiar natural radiator is the sun, which emits energy as short visible waves of light and longer invisible waves of heat; the difference is one of wavelength, because when a body is exposed to light it warms up just as by the absorption of radiant heat. If a beam of sunlight is passed through a prism it spreads out into a band of colours varying from violet, at one end, through blue, green, yellow, and orange, to red at the other. Rays beyond the violet are known as the ultra-violet, and rays beyond the red as the infra-red or heat rays. On the assumption that the sun is a black-body radiator at a temperature of $6,000^\circ \text{A.}$, the energy-wavelength curve shows the greatest intensity about a wavelength of 0.5μ , *i.e.* the blue-green region of the spectrum. About half of the total energy is in the range of wavelengths $0.4\text{--}0.7 \mu$ (visible rays); most of the remainder at wavelengths greater than the 0.7μ of the visible red rays; and practically the whole within the limits $0.2\text{--}3 \mu$ (*i.e.* short-wave radiation). The earth's surface acts as an almost perfect radiator, and the radiations from the earth or its atmosphere (at temps. of about 300°A.) are within the limits $4\text{--}50 \mu$ (*i.e.* long-wave radiation). Snow surfaces appear white because they reflect a high proportion of the solar rays falling upon them, but they readily absorb long waves and at their own temps. are effective black-body radiators.

The principal gases of the atmosphere, oxygen and nitrogen, are transparent to practically all

of the solar and sky radiation and also to that which the earth re-transmits. Carbon dioxide and water vapour, however, strongly absorb energy at certain wavelengths; hence the latter, as clouds, plays a major rôle in regulating the temperature of the globe. The cooling of the ground on a clear night is a result of the outgoing long-wave radiation exceeding that coming down from the sky; at sunrise cooling ceases as the incoming radiation becomes sufficient to compensate for the loss of heat. The most conspicuous signs of appreciable terrestrial radiation are deposits of dew and hoar-frost. It is believed that the absorbing power of water vapour is equally important in the meteorology of the upper atmosphere, for it is mainly because of the absorption of long-wave radiation that the temp. of the stratosphere is maintained. See Energy; Heat; Light; Radio-activity.

A. J. Drummond, F.R.Met.S.

Radiator. Any body capable of emitting energy in the form of rays. Such energy is given off in all directions, but with greatest intensity only in rays projected perpendicularly from the emissive plane, the intensity varying directly with the sine of the angle of inclination. For this reason, a spherical surface, whether concave or convex, is more efficacious than any arrangement of plane surfaces. Greatest concentration of energy occurs at the centre of a spherical container, and the widest dispersal is from the outer surface of a sphere, as with the sun. The term is equally applicable to heat, to light and electrical impulses, and to all radio-active substances.

In reference to heat, this name is popularly misused to describe apparatus essentially convective. Examples are the room-warming radiator, and the nest of water-cooling tubes in front of a motor car. In both, the heat-dispersing surfaces are arranged in columns backed with hot water to provide a maxi-

Radiator.

Radiators, Ltd.

mum area for contact with air. All such fittings are designed to permit or create a convected flow of relatively cool air between the heated columns, so that heat may be conveyed away by the warmed air. A

Radiator. Fig. 2.
Back of a flat metal
plate radiator, showing waterways
Ideal Boilers and Radiators, Ltd.

room-warming radiator is shown in Fig. 1 for comparison with the flat panel of Fig. 2.

The room-warming device is frequently a flat metal plate provided with hidden waterways (Fig. 2) coupled to a system of hot water pipework. These may be arranged as wall or ceiling panels backed by thick insulating pads, and so placed as to remain unobscured by furniture and curtains. Floor-warming panels are fitted with expanded metal on which a concrete or terrazzo floor is laid. Another arrangement converts some part of the walls and/or ceiling of a room to a radiator.

Emissivity and reflectivity of a radiator are materially affected by the nature of the surface, but not appreciably by the colour. A dull matt makes for the greatest emissivity; the higher the surface polish, the better the reflectivity. Paints having metallic bases, copper, bronze, or aluminium, will reduce the emissivity of a heat radiating surface by fully 50 p.c. Gas- and electrically-heated radiant panels, usually of a ceramic material, are normally placed at high levels because of the relatively high operating temperatures.

Radical OR RADICLE (Lat. *radix*, root). Term applied in chemistry to elements (simple radicals) or groups of elements (compound radicals). It usually denotes a compound radical or group of units capable of passing unaltered from compound to compound. Radicals have no separate existence and can exist only in combination with one another as compounds. The names of radicals generally end in the syllable -yl, examples being hydroxyl (OH); carbonyl (CO); thionyl (SO); methyl (CH₃); carboxyl (COOH);

sulphuryl (SO₂); phosphoryl (PO); nitroxyl (NO). Among exceptions to this rule are ammonium (NH₄), and cyanogen (CN). Radicals are acidic, basic, or neutral in character. Two radicals of similar character do not combine unless they are both neutral.

Free radicals are those which can exist under certain conditions as separate entities. These are usually classified as of short life, e.g. methyl (CH₃) having an existence of a fraction of a second; or of long life, e.g. triphenylmethyl (C₆H₅)₃C.

In mathematics, a radical is a quantity that is, or is expressed as, a root of another; also the root sign, $\sqrt{\quad}$, $\sqrt[3]{\quad}$, etc.

Radical (Lat. *radix*, root). Term applied to those who desire large changes in the social and political order. In Great Britain the Radical party has been an advanced section of the Liberal party; its equivalent in France is the Left. The word was first used for politicians towards 1800, and after the French Revolution it became a popular term for those—Orator Hunt among them—who held advanced opinions. It was also applied to thinkers such as Bentham and James Mill, who were individualists and economists, but later Radicals believed in a constant enlargement of the area of state control. See Left; Liberal; Politics.

RADIO; WIRELESS SOUND TRANSMISSION

R. W. HALLS. M.I.E.E., Author of *Wireless Simply Explained*, etc
An explanation of the transmission and reception of signals by electro-magnetic waves, without the use of wires. Allied subjects are Radar; Telegraph; Telephone; Television. See also Appleton Layer; Broadcasting; Electro-Magnetic Wave; Frequency Modulation; Heaviside Layer; Quasi-optical Waves; Thermionic Valve

Radio (Lat. *radius*, ray) is the name given to the system whereby messages are transmitted to and received at distant places by means of electro-magnetic waves without the use of cables, wires, or other physical connecting links. Such messages may be in the form of the speech sounds of telephony, the speech, music, and other sounds of broadcasting, or the morse signals of telegraphy. Television is another branch of radio, the messages in this case having the form of gradations of light and shade into which visual images are dissected at the transmitter and from which the images are built up at the receiver. Yet another department of radio is radar.

The electro-magnetic waves used for the various forms of radio have the greatest wavelength, or lowest frequency, of all those known. They are classified as follows:

Wavelengths	Classes	Corresponding Frequencies
Above 10,000 m.	Very long waves	Below 30 Kc/s.
1,000–10,000 m.	Long waves	300–30 Kc/s.
100–1,000 m.	Medium waves	3 Mc/s.–300 Kc/s.
10–100 m.	Short waves	30 Mc/s.–3 Mc/s.
1–10 m.	Ultra-short waves	300 Mc/s.–30 Mc/s.
Below 1 metre	Micro-waves	Above 300 Mc/s.

Wavelengths of 1–10 metres are sometimes spoken of as metric, those from 1 cm. to 1 m. as centimetric, and those below 1 cm. as millimetric.

Each of the classes shown in the table has its own particular characteristics. In general, the attenuation, or loss of energy, due to the

resistance of the ground is comparatively light for waves of low frequency (great wavelength) as they follow the contours of the earth; the attenuation increases as the frequency is raised. Exactly the reverse, however, occurs when waves are turned back to earth by one of the reflecting layers; the higher the frequency (or the shorter the wavelength) of the reflected wave, the less is the attenuation that it suffers. Thus the very long waves have almost no reflected, or "sky-wave," component; while the short waves have negligible "ground-wave" ranges, but cover enormous distances by reflection. The very long waves travel over the surface of the earth and may have a world-wide range if emitted by high-powered transmitters. They are chiefly used by commercial telegraphy stations. The long waves also follow the contours of the ground; but being of higher frequency they have a more limited range. They are used by commercial telegraphy

stations and by certain long-wave broadcasting stations. The medium waves follow the ground contours, but are also reflected back to earth from the Heaviside layer (or E-layer) after dark. Distant transmissions are not heard by day, since the ground wave has but a limited range owing to heavy at-

tenuation. By night the reflected wave, or sky wave, may provide reception at great distances. The phenomenon called fading is due to the interaction of waves arriving by different paths. When two sets of waves arrive at the receiving aerial "in step" (in phase) the resulting signal is very strong. No signal at all is received if waves of equal amplitude cancel out by arriving exactly "out of step" (180° out of phase). Between these two extremes an infinite number of modifications due to interaction may occur. The medium waves are used chiefly for broadcasting and for short-range ship communications.

The short waves travel almost entirely by reflected paths. Reflection in this case takes place from the Appleton layer or F-layer. The most suitable wavelengths for long-distance communication vary according to the direction, the time of day, the season of the year, and the point reached in a sunspot cycle. By the use of the right wavelengths world-wide transmissions can be made with comparatively small power. The short waves are used for international telegraphy, telephony, and broadcasting. Fading on these wavelengths is due to the interaction of waves arriving by two or more different reflected paths.

Normally the ultra-short waves and the micro-waves are quasi-optical. They are not reflected by the E-layer or the F-layer, and their range is little beyond the horizon as seen from the transmitting aerial. In exceptional conditions, however, they may span much greater distances. They are used chiefly for short-range communications, such as police telephony, and for television. One of the features of the micro-waves is that they can readily be focused or concentrated into a beam; this is made use of in radar.

Electro-magnetic waves are made to convey a message by the process known as modulation. The transmitter when "idling" sends out a train of continuous waves (the carrier wave) of the same frequency and amplitude; when a message is sent it is superimposed on the carrier by being made to cause variations in its amplitude or frequency corresponding to those of the applied signal. Amplitude modulation and frequency modulation of a continuous carrier are in general use; pulse modulation is another method.

The key to radio was provided by the invention and development

of the thermionic valve. In the transmitter power is fed to the aerial by an oscillator valve (or

team of valves). Fig. 1 shows one of the ways in which a valve may be made to oscillate. Any voltage change in the grid circuit appears in magnified form in the anode circuit. By means of the coils L_1 , L_2 , the anode circuit is coupled to the grid circuit in such a way that voltages fed back from the former circuit assist and increase those in the latter. Any energy expended in overcoming resistance in the grid circuit is more than replaced by the feed-back from the anode circuit. The resulting greater voltage changes in the grid circuit give rise to still greater voltage and therefore current changes in the anode circuit. The D.C. power, drawn from the source of H.T., is converted by the valve into alternations or oscillations, the frequency of which can be controlled, by means of the tuned circuits consisting of the coils L_1 , L_2 and the capacitors C_1 , C_2 . If the output of the oscillator is fed to an aerial, magnetic and electric fields are produced round it by each half-cycle of current and voltage respectively. Each field increases in intensity and extent as, say, the positive half-cycle rises towards its peak, and decays as it falls towards zero. The decay of the fields is not complete by the time that the half-cycle comes to an end and the next (the negative) begins. The result is that energy in the form of a magnetic and an electric field "loops off" from the aerial at every half-cycle. The direction of the fields is reversed during each successive half-cycle; a series of electric and magnetic "crests" and "troughs," or electro-magnetic waves, is thus radiated from the aerial. These form the carrier wave, usually called simply the carrier, of the transmitter, (a) in Fig. 2.

To make the carrier convey a message it must be modulated, that is made to vary in either amplitude or frequency in exact accordance with the electrical

copies of the sound waves made by the microphone, or those of varying degrees of light made by the television camera. In telegraphy the carrier may either be modulated by impulses of long or short duration corresponding to the dashes and dots of morse, or it may be, so to speak, switched on and off for longer periods (dashes) or shorter periods (dots). Fig. 2 (b) shows a simple sound wave and at (c) and (d) are shown the ways in which the carrier may be modulated by it in amplitude (amplitude modulation

Radio. Fig. 2. (a) Unmodulated carrier wave of constant amplitude and frequency; (b) simple sound wave form; (c) amplitude-modulated carrier: frequency constant, amplitude varied; (d) frequency-modulated carrier: amplitude constant, frequency varied

or AM) or in frequency (frequency modulation, or FM). Fig. 3 shows diagrammatically the most important sections of a simple transmitter.

The effect of any kind of modulation is to superimpose on the carrier two bands of modulating frequencies called the sidebands. Suppose that the carrier, (a) Fig. 2, has a frequency of 600 Kc/s. and that the modulating frequency is 1,000 c/s. or 1 Kc/s. then the amplitude modulated carrier consists of

Radio. Fig. 3. The sections of a simple transmitter

a band of frequencies extending from $600 + 1 = 601$ Kc/s. to $600 - 1 = 599$ Kc/s., that is, the modulated carrier occupies not a single frequency, but a belt of frequencies, or channel, the width of which is twice the modulating frequency; if a carrier is modulated by a frequency of 1,000 c/s. or 1 Kc/s., the resulting transmission has a total

band-width of 2 Kc/s. The side-bands above and below the carrier frequency are called the modulation envelope, (c) in Fig. 2. Owing to the large number of European broadcasting stations which have to be fitted without mutual interference into the wavelengths between 200 and 550 metres (fre-

(1) One of the side-bands must be removed. If both were present they could not be made to operate apparatus which would produce an effect on the ear, for at any instant the crest of the upper side-band is exactly cancelled out by the trough of the lower: the diaphragm of a receiver would simultaneously be pushed and pulled equally, with the result that it would remain unaffected.

an audio-frequency order. The charge on the capacitor is built up by the crests of the H.F. impulses and has the resulting form seen in Fig. 4 (c). The effect of this reservoir capacitor is to mop up the H.F. impulses and to reconstitute the A.F. modulating envelope alone. In a crystal set the condenser discharges through the windings of the telephones, the diaphragms of which are made to execute vibrations (and so to produce sound waves which reach the ear-drum) in accordance with the variations of the modulation envelope.

Diode as Detector

Fig. 4 (d) shows a diode valve used as detector. Here rectification takes place because, owing to the one-way action of the valve, current can pass from cathode to anode only when the latter is at a positive potential; and these conditions obtain only during the positive half-cycles of the current set up by the incoming signals. The time constant of the reservoir capacitor C and the resistor R is (like that of the reservoir capacitor and the telephone windings in the crystal receiver) of an A.F. order. Hence the charge appearing on C is as in Fig. 4 (c).

The triode is used in two chief ways as detector. Fig. 5 illustrates anode-bend detection. Here the grid has a standing negative bias sufficient to bring the working point to the top of the bend at the lower end of the grid-volts, anode-current curve. Positive half-cycles reaching the grid allow amplified anode currents of corresponding wave form to pass; negative half-cycles result in the passage of very little current. Charges of the same wave form as the modulation envelope are produced in the reservoir capacitor. When the triode is used as a grid leak and

quencies between 1,500 and 550 Kc/s.), each can be allotted a channel no more than 9 Kc/s. in width. This means that audio-frequencies above 4,500 c/s. are not transmitted. The whole of the broadcast band has a frequency range of 950 Kc/s. or 0.95 Mc/s. On the short and ultra-short waves there is far more elbow room and stations can occupy wider channels. Between 20 m. and 55 m., for instance, there is only a 35 metre difference in wavelengths; but the corresponding frequencies, 15 and 5.5 Mc/s., differ by 9.5 Mc/s., or 9,500 Kc/s., or 9,500,000 c/s. The vision transmitter of the London television station actually occupies a channel 5.4 Mc/s. in width (about $5\frac{1}{2}$ times the width of the entire medium-wave broadcast band), whilst the accompanying sound has a channel 24 Kc/s. in width. Better quality is to be expected within its service area from such a transmission than from any medium-wave station owing to the greater range of audio frequencies that can be transmitted.

The modulated electro-magnetic waves sent out by the transmitter induce corresponding voltages in any aerial within their range which is tuned to their carrier frequency. Such voltages give rise in the receiving set to an electrical copy of the high-frequency carrier and both its modulating side-bands. For the message to become intelligible two things are necessary:

The process of, so to speak, dismounting the message from the carrier is known as demodulation, or detection. The following is an outline description of this process.

The first of the steps mentioned above is accomplished by rectification, which removes one half of each of the high-frequency oscillations, corresponding to the carrier. Rectification may be done by means of a device such as a crystal detector Fig. 4 (b) or a diode valve Fig. 4 (d) which passes current in

one direction only. In (a) in Fig. 4 it is assumed that only the positive halves of the waves are accepted by the device. The result of rectification alone would, as Fig. 4 (a) indicates, be that the unwanted H.F. oscillations were still there. The second essential step may be taken (b) in Fig. 4, by applying the rectified impulses to a capacitor circuit whose time-constant is of

condenser detector (Fig. 6) the cathode and grid function in the same way as the cathode and anode of a diode, C corresponding to the reservoir capacitor and R to the load resistor. The grid, when the valve is idle, is at about the same potential as the cathode. A positive half-cycle sends the grid positive, and electrons from the cathode are attracted to it, causing a flow of current from cathode to

grid. These H.F. flows of grid current build up across the capacitor and on the grid negative charges at audio frequency, discharge taking

place through R . The A.F. voltage variations on the grid cause corresponding amplified changes in the anode current. The time constant of R and C is again of an A.F. order. Used in either of the ways described, the triode forms an amplifying detector.

Receiver's Tuning Circuit

The form of tuning and the tuned circuit most commonly used in the radio receiver consists (Fig. 7) of a coil and a capacitor in parallel.

Radio. Fig. 7. The parallel tuned circuit. The arrow through the capacitor indicates that its capacitance is variable

To make it possible to tune the circuit to any one of the various carrier frequencies included in, say, the medium-wave band, the capacitance is variable: one set of the vanes of the capacitor (the movable vanes) can be moved so as to mesh more or less completely with the fixed vanes. This is what takes place when the tuning knob of a wireless set is turned.

The reactance (symbol X), that is, the opposition to the passage of an alternating or oscillating current, over and above ordinary resistance, offered by either a coil or a capacitor, depends upon the frequency of the current. For a coil

$$X = 2\pi fL,$$

for a capacitor

$$X = \frac{1}{2\pi fC},$$

where f is the frequency in cycles per sec., L is the inductance in henries, and C is the capacitance in farads. At resonance, that is when the circuit is exactly tuned to the incoming frequency, X_L , the inductive reactance of the coil is precisely equal to X_C , the capacitive reactance of the condenser. These two kinds of reactance have opposite effects on the phase of the incoming oscillations. X_L causes the current to lag 90° on the voltage; X_C causes it to lead 90° on the voltage. Thus, when $X_L = X_C$ the coil current and the condenser

current are 180° out of phase and cancel out. Hence there is no current through the circuit and its dynamic resistance is infinitely great at the resonant frequency.

Or, rather, it would be so if the circuit contained no resistance of the ordinary kind. But, except in conditions obtainable only in an exceptionally well equipped physics laboratory, any conductor must have some resistance—and a circuit without conductors is impossible. The effect of ordinary, or ohmic, resistance is to reduce the current lag due to X_L and the current lead due to X_C . In other words, X_L and X_C cannot quite be equal and opposite, and, therefore, cannot entirely cancel out, if the circuit contains (as it must) even a small amount of ordinary resistance. The smaller the amount of this resistance the greater is the efficiency of the circuit. As most of the wire in the circuit goes to make up the turns of the coil, it is the coil that is most likely to introduce appreciable resistance. The efficiency, or selectivity, of a tuned circuit is, therefore, determined chiefly by the smallness of the resistance of the coil. The Q , or efficiency factor, of a coil, is the ratio of its reactance to its resistance:

$$Q = \frac{2\pi fL}{R}.$$

What really matters is to keep the ratio of the quantities L and R as high as possible; ideally R must be negligibly small with respect to L . The Q of a coil indicates the magnification of the applied voltage which takes place across it at resonance. One of the curiosities of alternating and oscillating current is that such magnification can take place; if it did not, radio would be impossible. Fig. 8 shows the response of circuits containing coils of different Q s to a resonant frequency and to frequencies above and below it. The higher the Q the

greater is the selectivity of the circuit. A high- Q circuit tunes in the wanted transmission by respond

Radio. Fig. 8. Curves showing the "response" of high- Q and low- Q medium-wave coils. The voltage across the high- Q coil is high at the resonant frequency, but falls away steeply only a few kilocycles above or below it. Hence the response to the wanted signal is good and that to unwanted signals poor. The selectivity is good. On the other hand, the low- Q coil does not show a high voltage for the wanted signal and the selectivity is poor because unwanted signals many kilocycles off resonance develop voltages not markedly lower

ing strongly when tuned to its frequency. In such conditions it tunes out unwanted transmissions by responding poorly to them. Increased selectivity is obtained by the use of a number of tuned circuits in cascade. For broadcast reception with a sensitive set from 8 to 10 tuned circuits in cascade are required in order to provide an acceptable degree of selectivity.

In Fig. 9 is seen the circuit of a simple single-valve receiver. Since the coupling between L_1 and L_2 is variable, the amount of feed-back from anode to grid circuit can be adjusted until the valve is just short of oscillation. In that condition the energy fed back from the anode circuit to the grid circuit almost annuls the effects of resistance in the tuned circuit $L_1 C_1$. The Q of the circuit can become in this way enormously high in a well-designed set, with the result that the sensitiveness and selectivity may be quite remarkable.

Where a loudspeaker is used, the signal must be amplified. Normally this is done at high frequency (i.e. before detection) as well as at audio frequency (i.e. after detection). When the valve is used as an amplifier the working

Radio. Fig. 9. A simple single-valve receiver. $L_1 C_1$, tuned circuit common to aerial and grid; L_2 , reaction coil (the arrow through L_2 indicates that the coupling between them is variable); C_2 , grid capacitor; C_3 , reservoir capacitor; R , grid resistor (or grid leak); B_1 , filament battery (or low-tension battery); B_2 , anode or high-tension battery

point is adjusted (by applying a suitable amount of negative bias to the grid) to be at about the middle of the "straight portion" of the grid-volts, anode-current characteristic. As seen in Fig. 10 no rectification then takes place and (ideally) the cycles of anode current are exact and faithful copies of those of grid voltage.

If an amplifying valve is followed by another valve, the current changes in the anode circuit of the first must be turned into corresponding voltage changes before they can be passed to the grid of the second. This may be done (Fig. 11) by making the anode current pass through the primary windings of a transformer (a), or a resistor (b). The potential drop brought about by the impedance of the former or the resistance of (b) gives the required voltage variations.

Transformer coupling is generally used for pre-detector or H.F. amplification, and resistance-capacitance coupling for the post-detector low-frequency stages. On the high-frequency side effi-

Radio. Fig. 10. The triode used as an amplifier. If another valve follows the current swings in the anode circuit can be made to appear as voltage swings by the use of a resistor or an impedance

ciency combined with selectivity sufficient to exclude unwanted frequencies is required, whilst on the audio-frequency side the amplifier should ideally handle equally well all the frequencies applied to its circuits.

The only valve that is normally required to pass on current changes from its anode circuit is the output valve, for both the telephone (Fig. 8) and the loudspeaker (Fig. 11) are current-operated devices. Either telephones or loudspeakers, if suitably wound, may be connected directly into the anode circuit of the output valve; but for loudspeakers it is usual to use a transformer, (c) in (Fig. 11, whose purpose is to match the impedance of the instrument's windings with the anode circuit impedance of the output valve.

Receivers of the kind illustrated in Fig. 11 are less and less used, owing to increasing need for selectivity because of the crowding of the wavebands used for broadcasts. To obtain the 8-10 tuned circuits desirable for broadcast reception in a straight set, such as that of Fig. 11, would call for an 8-gang or 10-gang variable condenser, which would be a very expensive component.

A most successful way out of the difficulty has been found in the number within reason may be used) have fixed values of inductance and capacitance. A super-

neighbourhood of 460 Kc/s.) called the intermediate frequency. The I.F. tuned circuits (of which any

Radio. Fig. 12. Block diagram to illustrate the principle of the superheterodyne receiver. In broadcast receivers the H.F. stage is often omitted, the greater part of the pre-detector amplification being done by the I.F. stages. In such cases 8 or 10 tuned circuits can be obtained with only a 2-gang variable capacitor. The tuning of the I.F. stages is fixed and may be effected by means of small pre-set capacitors

means of the frequency changer the frequency of any carrier tuned in is automatically converted to one fixed frequency (usually in the

heterodyne receiver of selectivity adequate for broadcast reception need contain no more than a 2-gang or 3-gang variable capacitor.

RADIO-ACTIVITY AND THE ATOM

* R. W. B. Stephens, Lecturer in Physics, Imperial College of Science and Technology, London

For related information see *Atom*; *Crookes*; *Curie*; *Matter*; *Radium*; *Uranium*; *X-Rays*

The term radio-active is usually understood to apply to those substances such as uranium, radium, thorium, actinium, and their compounds, which have the special property of spontaneously emitting radiations possessing the following characteristics:

1. They will penetrate substances opaque to ordinary light; for instance, they will penetrate sheets of metal.
2. They will affect a photographic plate in a dark room.
3. They will produce luminescence and phosphorescence in certain substances placed near them, notably in barium platino-cyanide, zinc sulphide, and calcium tungstate, and in the minerals zincolite and willemite.
4. They have the power of "ionising" any gas through which they pass, that is, rendering it a conductor of electricity; hence these radiations will discharge electrified bodies.

5. They will develop heat continuously in any matter which absorbs radiation.

These properties are exhibited by other radiations, e.g. by Röntgen or X-rays, but the essential difference between X-rays and radio-active radiations is that the former have to be excited by some external agency, whereas the latter are spontaneously emitted from radio-active substances, and are entirely independent of any external exciting cause. In other words, they are due to the breaking-up or disintegration of the actual atoms of the radio-element. We may regard the latter as being in an unstable state and continuously disintegrating, giving rise to new atoms which differ entirely in chemical properties from the parent element. This instability is found in nature chiefly in the heaviest atoms, i.e. those with densities (and atomic numbers) greater than lead. Radio-active

isotopes of potassium, rubidium, samarium, and lutecium also occur naturally.

Historically, the impetus for the discovery of radio-activity was provided by the discovery of X-rays in 1895, by Röntgen. In the following year Becquerel examined a number of phosphorescent and fluorescent substances, to see if they emitted photographically active rays, and found that salts of uranium were effective, *independent of previous exposure to light*. Later, other substances were found to give off similar rays.

Special methods of measurement were devised for studying the radio-activity of these elements, the most useful being based on the ionising property of the rays. The "ionisation current," through a layer of gas exposed to the rays, can be measured by the rate at which it discharges a gold-leaf electroscope, and this gives a comparative measure of the activity of the substance used.

The next advance made was the discovery of the nature and classification of the types of rays given off by radio-active elements. Experimentally it is observed that their penetrating powers are widely different; some, for instance, are stopped by a sheet of paper, others will pass through a few inches of lead. Secondly, it is found that some of the rays are bent by a magnetic or an electric field, proving them to consist of minute electrically charged particles moving at high speed; the direction of the deviation gives the nature of the charge carried by the rays, that is, decides whether they are positively or negatively electrified, while the amount of the deviation gives an estimate of the speed and mass of the particles. Using these methods of measurement, Rutherford showed conclusively that the radiations from radio-active substances were of three distinct types, which he called the alpha, beta, and gamma rays (α , β , γ).

Nature of α and β Rays

The α rays are positively charged particles, each of mass four times that of the hydrogen atom. They are emitted at high speeds, about the order of 10,000 miles a second, but are very easily stopped, *e.g.* a sheet of ordinary writing paper will stop the swiftest known α rays. They travel up to about 3½ inches in air at ordinary pressures, but they ionise the air very intensely indeed in their short range. They will also produce very strong photographic and phosphorescent effects. Finally they have definitely

been proved to be electrically charged atoms of helium.

The β rays are also corpuscular in nature, and consist of very high-speed, negatively-charged particles of small mass (about two thousand times less than mass of the hydrogen atom). That is to say, β rays are electrons moving with high velocity. Their range is from 10 to 20 times greater than that of the α rays, and they can pass quite easily through thin sheets of aluminium. The fastest known β rays are emitted with velocity approaching that of light. The ionising power of the β rays, however, is only small—about 100 times less than that of the α rays.

The mass of the β rays being so exceedingly small, although their average velocity is great, their momentum is small, and hence they are easily deflected or bent by magnetic or electric fields, the direction of the deflection being opposite to that of the α rays. In character the β rays are identical with the "cathode rays" produced when an electric discharge passes through a rarefied gas.

Electromagnetic γ Rays

The γ rays are not corpuscular in nature, but consist of electromagnetic impulses of very short wavelengths. Hence in character they are analogous to X-rays. The γ rays, bearing no electric charges of any kind, are therefore not deflected in magnetic or electric fields, and are far more penetrating than the α or β rays—they will pass through several inches of aluminium. The ionising power of these rays is still smaller than the β rays, and about 1,000 times less than that of the α rays, and their photographic and phosphorescent actions are correspondingly small.

The effect of a magnetic field in separating out the radiations is shown in the figure. A beam of the rays emitted by a small amount of radium at R is subjected to a magnetic field at right angles to

Radio-activity. Diagram illustrating effect of magnetic field in separating radiations. See text

the plane of the paper, and directed downwards. The β rays are bent to the right, showing them to be negatively charged particles, and the amount of the deflection is large, proving them to be of small mass. The α rays are bent to the left, and are therefore positively

charged particles, whilst the extent of the deflection is very small (compared with the β rays), showing them to be of relatively large mass. In the diagram, the bending of the α rays is greatly exaggerated. Lastly, the γ rays go straight on without any deflection, proving them to be electrically uncharged.

In order to account for the phenomena of radio-activity, Rutherford and Soddy put forward the transformation theory, according to which the atoms of a radio-element are undergoing a process of spontaneous disintegration, with the production of new atoms possessing different, yet distinct, chemical properties. The radiations given off are parts of the disintegrating atom (hence the conservation of matter is preserved), and they provide a measure of the rate of breaking up of the atoms. The new atoms formed may be unstable and break up in their turn, giving off a characteristic type of rays, and this transformation process continues through a number of stages. There are three series of the heavy radio-active elements each ending in an isotope of lead.

The relative intensity of a radio-active source, as measured by the number of particles disintegrating per second, varies logarithmically with time.

Only about one atom of radium in about 100,000,000,000 (one hundred thousand million) breaks up every second, or about half the atoms in 1590 years, and each disintegrating atom expels an α particle. The residual atom is called radon, which is a heavy gas, much more unstable than radium, and transforms with the expulsion of an α particle to half-value in about 3.82 days. A number of succeeding transition products are derived from the radium emanation, denoted by the names radium A, radium B, radium C, to radium F, the transformation of each member of the family being accompanied by the emission of either α or β particles, or both. Each of these transition products is to be regarded as a new element, although some have only an average life of a few minutes.

Many of these products have names which were significant at the time they were so expressed, but do not indicate the nature of the isotopes they represent, *e.g.* radium C and radium E are isotopes of bismuth.

The continuous production of fresh radio-active matter by a radio-element, and the continual decay of the matter so formed, according

to a definite law, explains quite satisfactorily all the known facts of radio-activity. It is important to emphasise that these changes go on quite spontaneously, and cannot be controlled by outside agencies in any way—they proceed at the same rate, at temperatures varying from that of liquid air ($-186^{\circ}\text{C}.$) to that of an electric furnace ($2,000^{\circ}\text{C}.$), and are unaffected by chemical combination: hence the use of radio-active isotopes as "tracer elements," which make it possible to follow the course of particular substances through animal or plant metabolism.

The production of helium in the decay of uranium provides a means of estimating the age of uranium and hence of the earth, assuming the retention of the helium formed and provided no other source of the gas is present. Such investigations on terrestrial ores and on meteorites have led to estimates of the age of the earth up to 2,800 million years.

The Alpha Ray

Radio-activity has clarified our conception of the atom. It has introduced us to an electrically charged atom of helium (the α ray), which appeals to our physical sense, inasmuch as it can be detected individually, either by its action on a fluorescent screen, as in the "spintariscopes," where each atom (α particle) striking the screen produces a visible pin-point of light ("scintillation"), or by its electrical effect in causing movement of an electrometer. Devices which will indicate and record the passage of a single particle are chiefly dependent upon an observation due to Gorton, *viz.* that the voltage which has to be applied to produce a breakdown discharge from a charged conducting point could be varied considerably by irradiating the gas in the neighbourhood. These tube counters are now usually termed Geiger counters and the incidence of a single ionizing particle on such devices may be sufficient to cause a discharge. Such discharges may be rapidly "quenched" so that the counter becomes available to receive the next particle. The mechanical registration of the particles is limited to 3 or 4 thousand per minute but a system of thermionic valves may be arranged so that a single count is made for each 2^1 , 2^2 , 2^3 , or 2^4 incident particles and yet single particles can also be numbered at the same time by a system of glow lamps or a direct-reading meter. The Wilson cloud chamber is an

apparatus which gives a visible picture of the paths of fast atomic particles in gases by means of water droplets collected in the ions formed in the tracks of the particles. Photographic plates have also been used as a means of recording fast atomic particles. This method has been greatly assisted by improved photographic emulsions, and it has an advantage over the cloud chamber in being continuously sensitive.

Besides the natural radio-active substances, it is possible to produce radio-active isotopes of almost all the elements by making use of the atomic changes which take place under bombardment by various particles, chiefly neutrons. This can be done on a small scale in atomic disintegration machines (cyclotrons, synchrotrons, etc.), and on a larger scale in atomic piles. The latter have consequently become the chief sources for the supply of tracer elements for use in industrial and biological research.

Radio City. Group of five buildings in the Rockefeller Centre, New York. It consists of a

and is the largest office structure in the world; the R.C.A. west building, 243 ft.; and a theatre. See Rockefeller Centre.

Radio Control. Method whereby the transmission of radio impulses on a fixed wavelength actuates distant mechanisms. Attached to the mechanism is a radio receiver tuned in to the wavelength of the transmitter, and the impulses received are passed through amplifiers to be converted into mechanical power. Unmanned ships and aircraft navigated through radio control are used for artillery practice, and in the Second Great War bombs, rockets, and other missiles were thus guided to their targets. See Remote Control.

Radiograph. Name given to a photograph by X-rays (*q.v.*). It was found by Lenard in 1894 that the rays from a Crookes tube affected a photographic plate very much as light affected it, and in 1896 Röntgen obtained a radiograph of the hand, showing that flesh was almost transparent and bones by contrast opaque to the rays. The lodgement of foreign substances in the body, the fracture and diseases of bones, and even digestive processes by suitable diet, can be observed by radiographs, as can the presence of

music hall, 121 ft. high and seating 6,200 people, the largest indoor theatre in the world; the R.K.O. building, 409 ft.; the R.C.A. building, 70 storeys, with an observation roof and 12 terraced gardens, which houses the studios and headquarters of the N.B.C.

some diseases, *e.g.* tuberculosis. The method has been extended to the study of the internal structure of many substances, detecting flaws in machinery castings, etc.

Radiography. Art of producing an X-ray picture or radiograph (*v.s.*). It is highly technical

Radiography. Taking a radiograph of the chest and lungs as a test for the presence of tuberculosis

and depends upon the correct choice of film, electrical factors, type of X-ray apparatus, etc., in relation to the physical characteristics of the object. Training takes at least two years and comprises a knowledge of anatomy, physiology, radiation, physics, electricity, photography, and the construction of X-ray apparatus. Radiography is classed as a dangerous occupation.

Radiolaria. Order of Protozoa, of the class Rhizopoda. They have a large number of thread-like pseudopodia, and a siliceous skeleton or shell, often of great beauty. The single-celled body is usually spherical or conical in form, and the protoplasm is divided into inner and outer portions by a kind of membrane pierced with many pores, so that both are in vital connexion. All the radiolaria are of microscopic size, and their skeletons form a considerable part of the ooze which covers large tracts of the ocean bed at moderate depths. At greater depths the ooze is exclusively radiolarian in character. Reproduction takes place mainly by fission; but at other times two kinds of flagellate spores are formed, and it is probable that these conjugate, thus exhibiting both sexual and asexual propagation. See Ocean.

Radiolocation. This subject is treated under Radar.

Radiology. Science concerned with the study of phenomena associated with X-rays. It comprises detailed knowledge of the physical characteristics of the radiations and their application to everyday use. The discovery that X-rays will penetrate opaque substances and portray their internal structure led to their early application in the field of medicine. Laboratories throughout the world investigated the physical characteristics of the rays; medical organizations correlated radiologi-

cal images with normal and pathological processes. In medicine X-rays are used for diagnosis (radio-diagnosis) and for treatment (radio-therapy). This work being dangerous, recommendations for protection of X-ray workers were introduced by the League of Nations and

adopted in a number of countries. The use of X-rays in industry is being constantly extended. See X-Rays.

Radiometer (Lat., *radius*, ray; Gr. *metron*, measure). Name given to an instrument invented by

Radiometer invented by Sir W. Crookes

Crookes to show motion caused by the action of light. It consists of a windmill with four metal vanes, each brightly polished or silvered on one side and blackened on the other. The four supporting arms are carried on a delicately pivoted vertical rod, and the whole apparatus is enclosed in a high vacuum. When placed in the light the windmill revolves with a speed depending upon the intensity of the light. The action is probably due to the difference of temperature of the blackened and silvered sides, the former absorbing more heat rays from the light and reacting on the molecules of the rarefied gas left in the vacuum.

The term radiometer is also applied to instruments which actually measure the intensity of the incident radiation by the rise in temp. of a blackened disk exposed to the radiation.

Radio-Micrometer. Instrument combining the properties of a thermocouple and a galvanometer. It is used to detect and measure feeble radiations, such as those emanating from astronomical bodies. The two elements of a thermocouple have their lower ends soldered to a blackened silver disk, which receives the radiations.

The upper ends of the elements are joined by a silver wire from which is suspended a quartz fibre carrying a galvanometer mirror. The thermocouple is placed in the centre of a thick iron block set inside a copper block, the end of which is carried up into a thick tube surrounding the suspended loop. This loop is placed between the poles of a magnet to form a moving-coil galvanometer of one turn. When radiations fall on the disk a rise in temperature occurs at the lower junction of the couple, inducing a thermo-electric current in the loop. This causes a movement of the quartz fibre and the mirror, and an indicator on a scale registers the strength of the radiation. See Galvanometer; Thermocouple.

Radio Sonde. Meteorological instrument which can be attached to a free balloon and transmit by radio signals representative of the temperature, pressure, and humidity during ascent. The transmissions are picked up by a radio receiver on the ground. Normally it is possible by this method to obtain information automatically up to heights of about 10-12 m. and at ranges exceeding 100 m. The balloon is inflated with hydrogen until it will lift the radio sonde at a rate of about 1,000 ft. per min.; as the balloon rises the external atmospheric pressure gradually diminishes, causing the balloon to expand until at bursting point its original diameter of about 6 ft. may be doubled. A parachute is included to break the fall, allowing the instrument, if recovered, to be used again. As the radio sonde makes upper air observations available almost immediately, the meteorologist receives a three-dimensional picture of the atmosphere. The device was introduced in France in 1927 by Idrac and Bureau.

Radio-therapy. Treatment of disease (e.g. cancer) by radio-active substances, i.e. radium, radium emanation. X-rays, etc. See Radium; X-Rays.

Radio Times. Weekly journal published by the B.B.C. Its main function is to print details of all B.B.C. programmes for seven days, together with explanatory reading matter and general information of the corporation's activities. It originated through the temporary refusal of newspapers in 1923 to continue printing B.B.C. programmes except at advertisement rates, and the first number appeared Sept. 28, 1923. Until 1936 it was

printed and published for the B.B.C. by the firm of George Newnes and Co., Ltd., but from 1937 it was printed in works specially built for the purpose by Waterlow and Sons, Ltd. As most of the programme information contained in the journal is unobtainable elsewhere, the circulation steadily increased with the popularity of broadcasting, and by 1950 had reached a weekly average of over 8,000,000 copies.

Radio Valve. For a description and explanation of its various forms see Thermionic Valve.

Radish (Lat. *radix*, a root). Genus of annual and biennial herbs of the family Cruciferae and genus

Radish. Bunches of two cultivated varieties of the vegetable

Raphanus. The garden radish (*Raphanus sativus*), whose native country is unknown, was introduced to the British Isles in 1548. Radishes prefer a light, rich soil, and thrive best in one which has been heavily manured for previous crops. Hence, when grown on a large scale, they should follow cabbages or other members of the Brassica genus. The first sowing in the open air should be made in March, in a sheltered position, and then, by making successional sowings once every three weeks until Oct., and subsequently in a heated greenhouse, a crop of radishes may be obtained all the year round.

The seed must be sown very thinly, as if planted too closely the roots will be hot in flavour and stringy. The long-rooted radishes are the best for early or spring sowing, and the round or turnip radishes for summer treatment.

Radium (Lat. *radius*, ray). One of the chemical elements. Its chemical symbol is Ra, atomic weight 226, atomic number 88, melting point 700° C. (1,292° F.). Discovered by Pierre and Marie Curie in 1898, it was isolated in 1910 from radium chloride. It is a silver-white metal, which tarnishes rapidly on contact with air.

It is found in all mineral ores containing uranium, the proportion between the content of the two metals being always the same, 3,200,000 of uranium to one of

radium. The chief radium-bearing ores of practical value are uranite, carnotite, pitchblende, gummite, curite, and torbernite. These occur in Bohemia, Cornwall, Colorado, S. Australia, and especially Katanga in the Belgian Congo, and the Great Bear Lake, Canada. The metal is in reality widely distributed throughout the earth, and may even exist in minute quantities in the human body.

Barium is its closest ally, and the two form analogous salts—bromides, chlorides, sulphates, carbonates, etc.—all far more stable than the metal. Radium and its salts are remarkable for their radio-active properties. (See Radio-activity.)

RADIUM THERAPY. Following the discovery of radio-activity and the isolation of radium salts by the Curies, research into the effects of radium rays on plant and animal tissues was undertaken. Histological findings in irradiated normal animal tissues were carefully tabulated and the effects on diseased tissue correlated. The destructive effect of radium rays was demonstrated by the occurrence of severe burns on the skin following the application of the element. From this developed its use, within restricted limits, in dermatological disease, and occasional cure of surface cancer was demonstrated. Deep cancers were unaffected by surface radiation. Later, improvement in the technique of application and especially of filtration of the rays, led to success in the treatment of deeper seated lesions.

During the early part of the 20th century another method of radium application involved the exposure of deep seated disease by surgical operation and the insertion of radium, enclosed in tubes, into the tumour. The radium tubes were removed after a certain interval of time. Many successes were reported as a result of this method, from which originated interstitial radium needling of malignant tumours. Radium packed into body cavities (e.g. the uterus, maxillary antrum, etc.) led to marked success in the treatment of disease in these regions. The effects are due almost entirely to the gamma rays of radium. As a rule the greater the malignancy of the tumour the more sensitive it is to the action of these rays.

In internal medicine radium is useful in certain blood diseases, e.g. leukaemia, while in generalised conditions, such as Hodgkin's

disease, lymphosarcoma, and generalised carcinomatosis, radium treatment affords palliation. Certain acute and chronic inflammatory diseases and many forms of skin disease can be treated.

Radium rays have a selective action on cells undergoing active and rapid division, such cells, which comprise the cancer growth, being destroyed by doses of radiation smaller than those harmful to normal cells. The ultimate mode of action on the cell is not known, but the cells are altered so that mitosis and reproduction cease, and the surrounding defensive and recuperative mechanism is strengthened.

Dosage in and application of radium therapy have to be very carefully controlled. Overdosage is disastrous in that normal tissue destruction results in severe radium burns which it is almost impossible to heal. Also the effect of overdosage upon the blood-forming mechanism leads to severe anaemia of the aplastic type which always results in death. As those who administer radium treatment are also liable to suffer ill-effects from the rays, in many countries the conditions of such work are regulated by law.

In Great Britain and the U.S.A. radium institutes exist for radium supply, investigation, and medical treatment. The address of the Radium Institute is 1-3, Ridinghouse Street, W. See Radio-activity; Radon; consult Chapters in the Chemistry of the Less Familiar Elements, B. S. Hopkins, 1940.

Radius. Outermost of the two bones of the forearm. It articulates at its upper end with the humerus and the ulnar and at its lower end with the scaphoid and lunar bones of the wrist. The upper extremity or head is disk-shaped, and has a depression in the centre which articulates with a protuberance on the humerus. At the side of the disk is the articular surface which rotates in the small sigmoid cavity of the ulna. On the upper part of the shaft of the bone is a rough tuberosity to which is attached the tendon of the biceps.

The muscles attached to the shaft are the flexor sublimis digitorum, the flexor longus pollicis, the pronator quadratus, extensors of the thumb, the pronator teres, and the supinator brevis. The lower extremity has a large surface for articulation with the wrist, and, on its inner side, a small surface which articulates with the ulna. A protuberance,

felt on the outer side of the wrist, is known as the *stiloid process*. When the arm is held in the position of supination, i.e. with the palm facing forwards, the radius is parallel to the ulna. When the arm is turned into the position of pronation, i.e. with the back of the hand facing forwards, the radius is crossed over the ulna.

Dislocation of the radius, which usually results from a fall on the hand, is most frequently in the

Radius. Diagram illustrating relative positions of bones of the forearm

forward direction, the head of the radius coming to rest against the lower end of the humerus. Reduction is effected by pulling on the wrist with the forearm bent at a right angle, pressure over the head of the bone being applied at the same time. Following reduction the arm should be kept at rest for several weeks.

Fracture of the radius may occur at any part of the bone, but is most frequent at the lower end, being usually due to a fall in which the hand is stretched out palm downwards to break the fall. This is known as *Colles's fracture* (q.v.). See Arm.

Radius (Lat., rod, ray). In geometry, name given to the distance of the circumference of a circle or the surface of a sphere from their centres. The radius of a taxi is, in London, a distance of 6 m. from the point of hiring; beyond this distance the driver can no longer be compelled to accept the terms shown on the meter. The geographical radius within which a taxi may ply for hire varies with the local authority granting the licence.

Radius Vector. In astronomy, name given to the line joining the position of a planet at any point in its orbit to the sun. Since the planetary paths are ellipses, the length of the radius vector varies, and the shorter it becomes the faster the planet moves. This fact is stated in Kepler's second law, that the areas described by the radius vector of a planet in its orbit are proportional to the times taken in describing them.

Radlett. Village of Herts, England. It is 5 miles S. of

St. Albans on Watling Street, and 15 m. by rly. N.W. of London. Wholly built since 1850, it is part of the ancient parish of Aldenham, and has become largely a residential area for Londoners. Pop. est. 5,000. The Radlett airfield is owned by Handley Page Ltd., and has been the main site of the experimental work carried out by that firm.

Radley. Village of Berkshire, England. It stands on the Thames, 4 m. by rly. S. of Oxford. S. John's Church is a modern building, and the hall, once the seat of the Bowyer family, is now part of the college which was founded here in 1847, its full

name being the College of S. Peter. It is a Church of England school, incorporated by royal charter in 1890, and has about 400 boys. A memorial gateway has been erected, inside the double arches of which are inscribed the names of boys and masters who fell in both Great Wars. Pop. est. 1,000.

Radnor. N.W. Village of Radnorshire, Wales. It stands on the river Somergill, 7 m. S.W. of Presteigne, with a rly. station. At one time a place of some size, it was incorporated in 1561, and

Radnor, EARL OF. British title borne in turn by the families of Robertes and Pleydell-Bouverie. John Robertes, Lord Robertes of Truro (1606-85), was created earl in 1679. He had been a leading man on the parliamentary side during the Civil War, but was afterwards among the supporters of Charles II, under whom he was lord-lieutenant of Ireland, lord privy seal, and lord president of the council. The title became extinct on the death of the 4th earl, unmarried, in 1757. The estates, however, passed to relatives, and after a time to Thomas James Agar-Robartes, Baron Robertes (1808-82), whose grandson, the 3rd baron, became Viscount Clifden in 1930. The family has long been settled in Cornwall, Lanhydrock, near Bodmin, the old seat of the earls, being their property.

The second family of earls began with William Bouverie, Viscount Folkestone (1725-76), the descendant of a rich merchant of Huguenot descent. He was made earl of Radnor in 1765. His son took the additional name of Pleydell on inheriting wealth from his maternal grandfather, and subsequently the family name was Pleydell-Bouverie. From him the later earls are descended. William, 7th earl (b. Dec. 18, 1895), who succeeded to the title in 1930, owns much land at Folkestone, and his chief seat is Longford Castle, Wilts. His eldest son is called Viscount Folkestone.

Radnorshire. Map of this inland county of Wales

retained its municipal privileges until 1883. There are remains of its castle, and part of the guildhall. About 3 m. to the S.E. is the village of Old Radnor. The waterfall Water-break-its-neck is 3 m. to the W. of New Radnor. Pop., estimated, 500.

Radnorshire. Inland co. of Wales. Its area is 471 sq. m. In the E. and S. it is fairly level, but the rest of the shire is hilly. The valleys contain picturesque and attractive scenery. The wild district in the centre of the county is known as Radnor Forest.

Radnorshire arms

The principal river is the Wye; others are its tributaries, the Elan, Lugg, Arrow, and Ithon.

The Elan supplies Birmingham with water. Radnorshire is a centre of agriculture, and oats and wheat are grown and sheep are reared, while about half the land is under permanent pasture. The county unites with Brecon to send one member to parliament. Presteigne is the co. town; others are Knighton, Rhayader, and Llandrindod Wells. In early times Radnorshire formed the district of Maesyfed, one ruled by the lords marchers after the conquest of Wales by Edward I. Its most notable ecclesiastical building was the rich Cistercian abbey known as Cwmhir. In 1536 it was made a shire on the English model, taking its name from Radnor, then an important place. Pop. 21,323.

Radom. Town of Poland and capital of a dist. of the same name in Kielce co. It stands on the river Mlechna and on the rly., about 60 m. S. of Warsaw. It has normally a trade in cattle, and tanning and distilling are important industries. In the First Great War the Austrians, defeated by the Russians at Ivangorod on Oct. 23, 1914, fell back on Radom, where a three-day battle developed and ended with the Russian occupation of the town. Radom was retaken by the Austrians in July, 1915. The town was overrun by the Germans in Oct., 1939, and remained in their hands after the Russian-German partition. It was taken by the 1st White Russian Front on Jan. 16, 1945. Pop., 1939, 77,900.

Radon. The heaviest known gas, atomic wt. 222, set up by the loss of helium from radium through disintegration; atomic No. 86. Known also as radium emanation, it belongs to the series of "noble" or chemically inert gases, which include neon, argon, and krypton. It is readily absorbed by charcoal and water, has a distinctive spectrum, and itself decays at a rapid rate to form radium A, which in turn disintegrates to form radium B, and so on up to radium

F, all of which substances form the so-called radio-active deposit. The state known as radium equilibrium occurs when the formation of radon reaches a maximum with corresponding changes down the series. It takes approximately 30 days to reach this peak of activity. The final product of the series is radium G, which emits no rays and is an isotope of lead. See Radio-activity; Radium.

Radstock. Part of the urban district of Norton-Radstock, Somerset, England. A market town, it is 16 m. S.S.E. of Bristol, and has rly. stations. The chief industry is coal mining, the town being the centre of the Somerset coalfield. Market day, Sat.

Radziwill, CATHERINE, PRINCESS (1858-1941). An American writer. Daughter of a tsarist officer of Polish birth, she was born at St. Petersburg (Leningrad), March 30, 1858, and at 15 married Prince Charles Radziwill, of a family descended from Frederick the Great. In Berlin she became a leader of aristocratic society. After her husband's death she married Louis Kolb-Danvin, and later went to the U.S.A., where she became naturalised and died, May 11, 1941. On European politics and court life, she wrote *Germany under Three Emperors*, 1917; *Intimate Life of the Last Tsarina*, 1928; *The Taint of the Romanovs*, 1931; *It Really Happened*, 1932.

Princess Radziwill, American writer

Rae, JOHN (1813-93). British explorer. Born in the Orkneys, Sept. 30, 1813, he studied medicine in Edinburgh, and in 1833 was appointed a surgeon in the Hudson Bay Company's service. In 1846-47 he undertook the exploration of the Committee Bay and a search for Franklin. In 1850 he made another attempt, and, combining survey with his search for the lost explorer, charted 700 miles of new territory. In 1853 he completed the survey of the W. coast of Boothia, and, incidentally obtaining definite news of Franklin's

John Rae, British explorer

death, earned the £10,000 reward offered for that information. Between 1858 and 1864 Rae made other Arctic voyages. He lived until July 24, 1893.

Rae Bareilly. Dist. and town of the Uttar union, India, in the Lucknow division. The dist. has the Ganges in the S.W. and Lucknow dist. on the N. The annual rainfall is 38 ins. Rice, wheat, and millet are the chief crops. The town is in the middle of the dist. and is a rly. junct. Area, 1,765 sq. m. Pop., dist., 1,064,804; town, 18,500.

Raeburn, SIR HENRY (1756-1823). Scottish portrait painter. Born at Stockbridge, near Edinburgh, March 4, 1756, he was apprenticed to a goldsmith in Edinburgh. He soon began to paint water-colour miniatures of his friends, and, after studying with David Martin, passed

Sir Henry Raeburn, Scottish painter
Self-portrait

to portraiture in oils. In 1778 he married Ann Leslie, a widow with means. On the advice of Reynolds, he set out for Italy in 1785, and, having worked for two years in Rome, returned to his profession at Edinburgh. He painted most of the notable Scotsmen and Scotswomen of the day, his style being direct, crisp, vigorous, and masculine. His portrait of Dr. Nathaniel Spens, perhaps his masterpiece, is in the Archers' Hall, Edinburgh, and both the Edinburgh National Gallery and Portrait Gallery are rich in his works. The portraits of Mrs. James Campbell, Sir Walter Scott, and Sir John Sinclair may be noted. He was elected A.R.A. in 1814 and R.A. in 1815; knighted in 1822; and in 1823 became the King's limner for Scotland. He died in Edinburgh on July 8 of the same year. *Consult* Lives, W. R. Andrew (his grandson), 1886; Sir W. Armstrong, 1901; E. R. Diddin, 1925; Sir H. R., W. E. Henley, 1890; and the essay in R. L. Stevenson's *Virginibus Puerisque*.

Raeder, ERICH (b. 1876). German sailor. Son of a teacher, he was born at Wandsbek, April 23, 1876, and entered the navy in 1897. He served in William II's yacht, 1910-12, and became chief of staff under Hipper at the beginning of the First Great War, taking part in the Dogger Bank and Skagerrak battles, and commanding the cruiser Köln in 1918. In 1925 he commanded the Baltic sea

Admiral Raeder,
German sailor

naval forces until superseded by Doenitz in 1943, when he remained inspector-general of the navy. Tried as a war criminal at Nuremberg in 1946, he was sentenced to prison for life.

Raemaekers, Louis (b. 1869). Dutch cartoonist. Born at Roermond, Holland, April 6, 1869, he studied at Amsterdam and Brussels. In 1908 he started drawing political cartoons, and won international fame early in the First Great War for his scathing satires on the Germans. These appeared first in the Amsterdam *Telegraaf*, and were reproduced regularly in many Allied countries as expressing the sympathy of a neutral.

Rafa. Town on the Egyptian side of the Palestine-Egypt frontier. It lies 20 m. S. of Gaza, on the Mediterranean coast, and 30 m. from El Arish (q.v.). It is notable for a battle of the First Great War fought near here between a British desert column (New Zealanders, Yeomanry, and the Camel Corps, with artillery) under Sir P. Chetwode, and Turks, Jan. 9, 1917, during the British advance into Palestine. Though Rafa gave its name to the battle, the real struggle took place at Magruntin, Rafa being captured by the British.

Raff, Joachim (1822-82). Swiss composer. Born at Lachen, Schwyz canton, May 27, 1822, he studied science, but turned to music, being early encouraged by Mendelssohn. Closely associated with Liszt from 1850, he was an enthusiastic supporter of Richard Wagner, publishing a book, *Die Wagner-Frage*, in 1854. He settled in Wiesbaden, 1855, became director of the conservatoire of Frankfurt-on-Main, 1877, and died there June 24, 1882. Among his numerous works are violin concertos and sonatas, several operas, and the programme symphonies *Im Walde* and *Lenore*; but his place in the affections of a wide public is chiefly due to a tuneful little composition, *Cavatina*.

Raffaellino della Colle (1490-1566). Italian painter. He was born at Colle in Tuscany, and studied under Raphael, whom he

helped in the Vatican and Farnesina palaces at Rome. Later he became a pupil of Giulio Romano (q.v.). His principal works are a *Resurrection* and an *Assumption*.

Raffia Work. The manufacture of a variety of articles from bast dyed in different colours. Raffia has long been used in kindergarten and other schools for young children as a good and inexpensive medium for manual training. It is usually obtained ready dyed. It is damped slightly and is then twisted on a board cut in the shape of the required object, or it may be plaited and used to make various articles.

When raffia is used for coarse but very effective embroidery, it is more satisfactory for the workwoman to dye the raffia herself to the exact colours required. Sometimes raffia is used as any other thread would be used, and embroidered straight on to the material; in other cases motives in raffia work are first made and then applied to the material in the same way as in other appliqué work.

Raffle. For the legal position in regard to raffles, see *Lottery*.

Raffles, A. J. Character featured in various books by E. W. Hornung (q.v.). First appearing in *The Amateur Crackman*, 1899, Raffles was probably the first fictional criminal to be acceptable as a hero to English readers. Playing impeccable cricket for the Gentlemen at Lord's, and burgling country houses at night, he was, in the opinion of most readers, the most convincing of all the "gentlemen burglars" of fiction. His success in books led to both stage and screen versions of his adventures, Gerald du Maurier played the stage part, 1906, and Ronald Colman in a film version.

Raffles, Sir (Thomas) Stamford (1781-1826). British administrator. He was born at sea, off the coast of Jamaica, July 5, 1781, and in 1795 entered the service of the East India Company. Ten years later he was sent to Penang, where he acquired great proficiency in the native languages.

In 1811 he was made lieutenant-governor of Java, a position which he occupied with distinction until the cession of the island to Holland in 1816. In 1818 he became governor of Bencoolen, Sumatra, and by his advice Singapore was acquired by the East India Company, 1819. He proceeded thither in 1822 to establish a government. He died July 5, 1826, two years after returning to England. While in the East, he made extensive scientific observations. His biographies include those by R. Coupland, new ed. 1946; E. Hahn, 1948.

Rafflesia. Genus of leafless and stemless parasites of the family *Rafflesiaceae*. They are natives of

Rafflesia. Flower of *R. arnoldi*, the leafless and evil-smelling parasite

the East Indies. The vegetative portion of the plant consists of threads, like the mycelium of a fungus, in the tissues of species of vines and figs, the only external evidence of its presence being afforded when the huge flower-bud breaks forth. The first species discovered, by Dr. Arnold and Sir Stamford Raffles in 1818, was *R. arnoldi*, 18 ins. across the opened flower. It is very succulent, and the petals, etc., vary from a quarter to three-quarters of an inch thick,

Raft. An inflated rubber raft capable of holding 100 men and weighing 79 lb. Top, a ship's wooden raft

and have reddish tint, and a smell like carrion which induces flies to fertilise it.

Raft (mid. E., spar, rafter; cf. Gr. *orophos*, roof). Collection of pieces of timber fastened together for support on water. It is used

for planks sent down to their destination by being allowed to float down a river. A raft bridge is a bridge supported on rafts, and a raft port is a square hole which some ships have for loading and unloading timber. Rafts are also carried on ships as part of their life-saving equipment. These are usually fitted with air canisters to give them greater buoyancy, while warships carry large oval rafts having floats filled with kapok (*q.v.*). There are also types of inflatable rubber rafts.

Rafter. One of the timbers fixed up the slope of a roof and supporting the tiling or slating

Rafter. Arrangement of rafters in a converted barn. Top, examples of the common rafter (A); principal rafter (B); and a purlin (C)

battens. Rafters are nailed at the feet to the wall plate, and at the head against the ridge. Intermediate support may be provided on horizontal beams called purlins. On house roofs rafters are usually 4 ins. \times 2 ins., spaced at 14 ins. apart. Principal rafters are the sloping members of a roof truss or principal, on which purlins are supported. These may be of timber, steel, or reinforced concrete. See Building.

Ragaz. Watering-place of Switzerland, in the canton of St. Gall. Situated at the entrance of the narrow valley of the Tamina, 31 m. S.S.E. of St. Gall and 1½ m. from Pfäfers (*q.v.*), it has various baths fed by the mineral waters of Pfäfers, a kursaal, etc. Some 30,000 invalids annually have visited the resort. The resident pop. is less than 2,200.

Ragged Robin. Name given to the pink campion. See Campion.

Ragged School. Name given to free schools for poor children

Ragged School. The Nelson Street (Camberwell) Ragged School in 1883

established by philanthropists early in the 19th century in Great Britain. The movement had its counterpart in Germany about the same time. Among the pioneers were T. Cranfield in S. London (1810). John Pounds (*q.v.*) at Portsmouth, and Thomas Guthrie (*q.v.*). A free school where the children were also fed was opened in Aberdeen in 1841, and the Field Lane Refuge in London, 1843. In the following year the Ragged School Union was founded to co-ordinate various charitable agencies for the care and instruction of the destitute poor, and of outcast and crippled children in particular. Day and night schools and Sunday schools were established. In 1914 the title was changed to The Shaftesbury Society and Ragged School Union. See Sunday School.

Raglan. Village of Monmouthshire, England. It is 7 m. W.S.W. of Monmouth, with a station on

the line against the Welsh, was replaced in the 14th century by a more massive structure. In 1646 it was defended for ten weeks against the parliamentarians, after which it was surrendered and dismantled. S. Cadoc's church has memorials of the Somerset family. Pop. 600.

Raglan, FITZROY JAMES HENRY SOMERSET, 1ST BARON (1788-1855). British soldier. A younger son of the 5th duke of Beaufort, he was born Sept. 30, 1788. Educated at Westminster school, he entered the army in 1804 and during the Peninsular War served on Wellington's

1st Baron Raglan, British soldier

staff. At Waterloo he lost a hand. After the war he was secretary to the British embassy in Paris, and sat in parliament for Truro, 1818-20 and 1826-29. From 1827 to 1852 he was military secretary to Wellington, whom he succeeded as master-general of the ordnance. Made a baron, Raglan in 1854 went out in command of the force sent to the Crimea. His conduct of the campaign was not free from blame, but he finished as a field-marshal and remained in charge until his death, June 28, 1855. (See Crimean War.) He gave his name to a style of overcoat sleeving. Raglan married a niece of Wellington, and his son, Richard (1817-84), became the 2nd baron. The 3rd baron, George (1857-1921), was governor of the Isle of Man, 1902-19. His son Fitzroy (b. June 10, 1885) succeeded him in the title and was known as an anthropologist.

Ragman Roll. Corruption of Ragimunde's Roll, a record of information regarding the benefices of the Scottish clergy, compiled for purposes of papal taxation by a papal legate named Ragimunde. Later the term was transferred to the rolls of parchment recording

Raglan, Monmouthshire. The main gateway of the ruined castle

the rly. from that town. Above the village stands the extensive and imposing ruins of Raglan Castle. Including a gateway and remains of the hall and towers, they give a good idea of the nature of a feudal stronghold. The first castle, built here by the Normans as a protec-

the acts of homage made to Edward I at Berwick in 1296. This document, a valuable source of information on the state of Scotland, was published by the Bannatyne Club in 1834.

Ragnarok. Norse name for the Götterdämmerung (*g.v.*) or Twilight of the Gods.

Ragout (Fr.). Highly seasoned relish, made of vegetables, truffles, sweetbreads, mushrooms, etc., and served with any savoury dish. Less correctly the name is given to a highly seasoned stew of mutton or other meat that has been cooked before. *Pron.* rag-oo.

Rags. Scraps and waste pieces of textile materials. New rags, *e.g.* the clippings from tailoring factories, return quickly to commerce. Cotton and linen rags of value in paper-making are separated forthwith from woollens, as are the pocketings and linings of woollen clothing. Rags eligible for remanufacture into woollen cloth are carefully graded according to their kind and colour. Some other rags are converted into a type of manure used in hop-growing.

Drying is the first process in manufacturing from rags. The expulsion of moisture facilitates the removal of dust by a machine in which the rags are whirled and beaten. After being oiled to minimise the breakage of fibre, the rags are disintegrated in a grinder, or devil, into which they are delivered by a travelling apron. Feed rollers grip the rags, and the hardened steel spikes of a revolving drum tear the woven fabric and throw the fibre forward, while any untorn cloth is automatically returned to the front by a fan-wheel and pins or other steel objects are removed by magnets. The woven structure is broken up, but threads remain imperfectly opened, and are separated into fibre in subsequent opening machines or upon the carding engine. *See* Shoddy.

Ragtime. Style of music, derived from the American negro's natural Blues (*g.v.*) in an attempt to present that style in a manner more palatable to the white man's ear. It is characterised by gaiety and vivacity, and its marked use of syncopation. The earliest published examples were Tom Turpin's Harlem Rag and Scott Joplin's Maple Leaf Rag, both 1896. The syncopation consists of stressing the second and fourth beat of the bar (in common time); and by fluctuation of accents and tied notes the music moves in a jumpy or ragged manner instead of flowing easily and steadily.

Ragtime took a good deal of its structure and material from the march, which accounts for its immediate popular appeal, an appeal which lasted in the U.S.A. until the end of the First Great War, although from 1911 onwards the jazz (*g.v.*) style was advancing and incorporating ragtime in its formation. Composing of good piano ragtime had virtually ceased by 1910. The earlier "rags" were never published in the U.K., which may account for the revival of interest in Dixieland music in the U.K. some 50 years later, with the adaptation of piano ragtime for orchestration.

The chronological order of the various negro styles adopted for the entertainment of white people may be stated very roughly as minstrelsy, coon songs, ragtime, jazz, and swing. The Chicago World Fair of 1893 was responsible for that popularising of negro dances which led to the introduction of the cakewalk, bombershay, and pasamala, all dances of African origin. These, in diluted form, became the foxtrot, the charleston, and all the numerous variants of these down to the jitterbug (*g.v.*).

The influence of ragtime on the work of serious composers may be recognized in Debussy's *Golliwog's Cake Walk* and *Minstrels*; Stravinsky's *Ragtime* for eleven solo instruments, and *The Soldier's Story*; Hindemith's *Chamber Music No. 1* (op. 24). Earlier there was Dvorak's *New World* symphony, based on themes from negro melodies, as were his *Nigger quartet* (op. 96) and *E Flat string quintet* (op. 97). The first, third, and fourth movements of the quartet are explicit syncopated rhythm, and suggest characteristics of early ragtime.

Rex Harris

Ragusa. Town of Sicily, in the prov. of Ragusa. It stands among hills at an alt. of 1,630 ft. overlooking the river Ragusa, 3 m. N.W. of Modica and 32 m. W.S.W. of Syracuse. The neighbouring rocks contain caverns with ancient tombs. Ragusa has been identified by some with the ancient Hybla Heraea, and by others with Ina. Manufactures include cotton and woollen goods. British and Canadian troops seized the town from the occupying Germans on July 12, 1943. Pop. 49,530.

Another Ragusa, on the Adriatic Sea, is now generally known by its Yugoslav name of Dubrovnik (*g.v.*).

Ragwort (*Senecio jacobaea*). Perennial herb of the family Com-

positae. It is a native of Europe and Asia. It has leafy stems about 4 ft. high, with deeply lobed, dark green leaves, and large clusters of bright yellow, rayed flower-heads. The bruised leaves give off an unpleasant odour. It grows by the wayside and, as a weed, in pasture; cattle will not eat it.

The species which flourished on bombed sites in London in the 1940s was a hybrid between *S. squelidus*,

Ragwort. Flower-heads of this wayside plant

transplanted in the 18th century from Sicilian lava fields to Oxford, whence its seeds were carried down the rly. to London, and *S. viscosus*, a groundsel native to S. England.

Rahab. Harlot of Jericho, who hid two spies sent in by Joshua before he attacked the city, and let them out again by a cord from her window on the city wall. The story is told in Joshua 2.

Rahere (d. 1144). Founder of S. Bartholomew's hospital, Smithfield, London. He is said to have come to England from La Perche, in Brittany, during the reign of William Rufus. He took holy orders, and his name appears as that of a prebendary of S. Paul's soon after 1115. Later he made a pilgrimage to Rome, and there contracted malaria. On recovering from this he made a vow to found a hospital for poor men. The story runs that S. Bartholomew, in a vision, ordered him to build a priory also, and selected the site. On Rahere's return to England, the title for the requisite land at Smithfield was granted by Henry I (Rahere being a favourite of his), and the building of the hospital on the site it still occupies was begun in 1123, that of the priory a little later. Rahere was master of the hospital until 1137, when he retired to the priory. He died Sept. 20, 1144. His tomb, upon which lies his effigy, is in the priory church, now known as S. Bartholomew the Great. *See* S. Bartholomew's Hospital.

Rahotep. Egyptian prince of the IIIrd dynasty. The mastaba-tomb of him and his wife Nefert, near Seneferu's pyramid at Medum, discovered by Daninos in Mariette's time, yielded two incomparable painted limestone portrait-statues, 4 ft. high, on stone seats, now in Cairo. A British Museum bas-relief from the tomb portrays Rahotep seated before a table of offerings, with hieroglyphs. *See* Egypt.

Rahu. Dragon or demon of Hindu mythology. It is believed to cause eclipses of the sun or moon.

Raibolini, FRANCESCO. Real name of the Italian painter, Francesco Francia (*q.v.*).

Raichur. District and town of Hyderabad state, India. The district is in the Marathwara division in the S.W. of the state, being adjacent to Bombay and Madras. Nearly the whole of the cultivable area is in use, mainly for native food grains. The rainfall is 22 ins. The Kistna and Tungabhadra rivers form the N. and S. boundaries. Area 6,791 sq. m. Pop. 994,000. The town is centrally situated on the Bombay-Madras rly. Pop. 32,000.

Raid. In international law, a hostile invasion of territory of a state at peace, undertaken without the sanction of any recognized political community. Historic examples are the Fenian Raid, from the U.S.A. into Canada, in 1866; and the Jameson Raid into the Transvaal, 1895-96. Such raiders have no claim to the rights of belligerents at the hands of the country invaded, which may deal with them according to its own laws. The country from which the raid was organized is liable for damages if negligence on its part can be proved. In Great Britain the organization of, or participation in, a raid into a friendly country is a crime under the Foreign Enlistment Act. (*See* Jameson Raid.)

In the military sense a raid is an attack against the enemy by a comparatively small body of men for some local or specific purpose. The trench raids of the First Great War were made to obtain prisoners and so establish the identity of the units engaged in a particular part of the line. The mobile fighting of the Second Great War provided few opportunities for these, and the term raid was more generally applied to attacks on enemy-occupied territory. British commandos raided enemy installations and other vulnerable points; when they attacked in cooperation with the

navy and R.A.F., combined operations raids were spoken of. Large-scale raids were called reconnaissance in force, *e.g.* the British and Canadian attack on Dieppe, Aug. 19, 1942.

In air warfare a raid is an attack by aircraft against an objective behind the enemy's lines, as distinct from air operations in close support of advancing troops and armour. *See* Air Raids.

Raiffeisen, FRIEDRICH WILHELM (1818-88). German economist and founder of agricultural cooperative banking. Born at Hamm on the Sieg, Rhineland, March 30, 1818, he was burgo-master from 1845 at various places; from 1852 at Heddesdorf, near Neuwied, where he died March 11, 1888. In 1847 Raiffeisen established the first agricultural cooperative banks at Heddesdorf and Weyerbusch. They soon found imitators, and within a few years a network of Raiffeisen banks was spread over the country.

Raikes, ROBERT (1735-1811). British philanthropist. Born at Gloucester, Sept. 14, 1735, he

Robert Raikes, British philanthropist

succeeded his father in 1757 as proprietor of The Gloucester Journal. Carrying on this work until 1802, he drew attention to the question of prison reform, but it was his establishment of a Sunday school in Gloucester in 1780 that made his fame, for his venture was the beginning of a nation-wide movement. Raikes died April 5, 1811. His statue stands in the Embankment Gardens, London. A study by G. Kendall appeared in 1939. *See* Sunday Schools.

Rail. Name given to birds of the family Rallidae, distributed over many parts of the world and distinguished by having laterally flattened bodies suitable for passing through dense undergrowth. They are comparatively long in the leg and toes. The tail is short and inconspicuous, the head small, and the beak usually rather long and more or less curved at the tip. In Great Britain the family is represented by the corncrake, coot, water-hen, and water-rail. The last named occurs sparsely in the fens and marshes. The plumage is olive-brown on the upper parts and grey below, and the bird has a conspicuous red beak. It is about 11

ins. long, and is to be found all the year round. It nests among the sedges by the sides of ponds and

Rail. The water-rail, of the family Rallidae, a swimmer and diver that nests in the sedges
W. S. Berridge, F.Z.S.

streams, is a strong swimmer and diver, and flies only when compelled. Three other rails, the spotted, the little, and Baillon's, occur in Great Britain. *See* Coot; Corncrake.

Railax Letter Service. System of postal delivery operated by the G.P.O. and British Railways. The postal packet is conveyed by post office messenger to the appropriate rly. station for dispatch by the first available train, and on arrival at the station of destination is immediately delivered to the addressee by another messenger, provided it arrives during the hours when messengers are on duty. In 1948 the charge was 3s. for 2 oz., and 3s. 6d. for 1 lb. (maximum). Registered letters are not accepted.

Railway Mania. Popular term for the wild speculation in railway shares which took place between 1842-47. The immediate success of the first rlys. induced financiers to project lines even where there was no economic justification, and shares in the companies they floated were eagerly purchased by all classes. Hundreds of fraudulent concerns were formed; uneconomic lines were bought up by company promoters and their shares offered to a gullible public. With the high prices offered for rly. holdings of any description, the shares of honest companies were fantastically inflated. One of the principal promoters and speculators was George Hudson (*q.v.*). Towards the close of 1847 the boom collapsed. A permanent result of the railway mania was that less populous districts were served by lines which otherwise might not have come into existence. *Consult* Facts, Failures, and Frauds, J. Evans, 1859.

RAILWAYS: HISTORY AND TYPES

B. W. C. Cooke, Assistant Editor, *Railway Gazette*

The origin and development of railway systems, with particular reference to that of the U.K., are here described. Methods of traction—steam, electric, Diesel, etc.—are described under Locomotives

The beginnings of the railway system of Great Britain, which was the pioneer in this form of traction, can be traced to mining practice. There is evidence of the use of trucks hauled or pushed over primitive forms of rail in central Europe about 1550, and before the end of the 16th century mining railways had been introduced into England from Germany. In co. Durham a number of lines were built from the pits to the river, one well-known example of which was the Tanfield wagonway the first section of which was constructed in 1671. Iron rails appeared in Cumberland in 1738; previously wooden rails had been used, later covered with iron to reduce wear and facilitate the movement of the wagons or "trams" of coal.

The first all-iron rails, called plate rails, were cast L-shape; an upright portion 2-3 ins. high on one side of each rail prevented the wheels of the truck from leaving the track. Where the railway had to cross an ordinary road, these projections were a source of inconvenience to other traffic and in 1789 William Jessop, of the Butterley ironworks, had the idea of having the projection to hold the vehicle on the track made as part of the wheel instead of the rail, and forming a groove in the plates to take this early form of flange. From these rails developed the forms commonly used.

Earliest Authorised Railways

The early mining railways were private concerns constructed and owned by those interested in the movement of the minerals. The traction was by animal power. Probably the first line authorised by the British parliament, which later insisted on exercising increasingly stringent control over all railway construction and activity, was that from Middleton to Leeds, sanctioned by an Act of June 9, 1758. The first public goods line in the world to be sanctioned by parliament was the Surrey Iron rly., incorporated on May 21, 1801, and opened from Wandsworth to Croydon on July 26, 1803. The first railway to convey fare-paying passengers (March 25, 1807) was the Oystermouth rly., opened about April, 1806, from Swansea to Oyster-

mouth and still surviving as the Swansea & Mumbles rly.; it has been worked successively by horse, steam, and electricity.

At first steam was used for goods traffic only. The Liverpool & Manchester rly., opened Sept. 15, 1830, was the first public railway with all traffic operated by steam traction. Steam railways were opened in the U.S.A., 1830; France, 1832; Ireland, 1834; Belgium, Germany, 1835; Canada, 1836; Russia, 1837; Austria, 1838; Czecho-Slovakia, the Netherlands, Italy, 1839; Switzerland, 1844; Poland, 1845; Hungary, the W. Balkans, 1846; Denmark, 1847; Spain, 1848; Brazil, Chile, Peru, 1851; India, 1853; Norway, Australia (Victoria), 1854; Portugal, Sweden, Turkey, 1856; Argentina, 1857; Luxemburg, 1859; South Africa, 1860; Paraguay, 1861; New Zealand, 1863; Greece, Rumania, Uruguay, 1869; Colombia, Ecuador, 1871; Japan, 1872; Guatemala, 1880; Newfoundland, 1881; Labrador, 1882; China, 1883; Bolivia, 1889; Sudan, 1900.

In 1945 there were some 783,000 m. of railways in the world, of which some 262,000 were in Europe (including the U.S.S.R.), 270,000 m. in Canada and the U.S.A., 86,000 m. in Central and S. America. Some 450,000 m. were state-owned. Twenty-five years earlier, a far larger proportion was in private ownership. Following the First Great War, more and more countries acquired and operated railways in their territories; after the Second, two of the largest privately-owned systems, those of Argentina (26,710 m.) and the U.K. (19,860 m.) passed in 1948 to state ownership.

In Great Britain the length of track, 19,860 m., represents 36,797 m. of single track running lines; in addition, there are 15,815 m. of sidings. Approx. 1,250,000,000 passenger journeys are made yearly; and some 262,000,000 tons of merchandise and minerals (more than half coal) are carried. Train mileage run yearly totals 373,000,000, and there are in use about 20,000 locomotives, 40,000 carriages, and 1,200,000 wagons. Total staff is 635,000 men and women.

During the First Great War, and after it until Aug., 1921, the

great bulk of British railways were under govt. control. Gross revenue increased, because the traffic was very heavy and large successive increases were made in passenger fares and goods rates; but working expenses increased still more, chiefly owing to the payment of higher wages to the employees, and the institution of an eight-hour day. In 1920, while the gross revenue was about double what it was in 1913, the expenditure had increased more than three-fold, and, according to the figures prepared by the railway accountants committee, the total net receipts of the controlled companies from all sources had fallen from £45.6 millions in 1913 to £8.9 millions in 1919, and to less than £6 millions in 1920. The pre-war revenue sufficed to pay an average of about 4 p.c. on the whole capital invested; that of 1920 was less than half required to meet the fixed interest on the debenture and rent charge stocks.

Railways Act of 1921

With the object of restoring the financial stability of the railways, and putting them again on a dividend-earning basis the ministry of Transport was formed by an Act passed on Aug. 15, 1919. One result of its efforts was the Railways Act, which became law in Aug., 1921, and was directed chiefly towards (1) reduction of expenditure by economy in management and administration, and by the elimination of the losses attributed to wasteful competition between the different companies; (2) increase of revenue through higher charges, to the extent necessary to bring the railways to the position of self-supporting commercial undertakings.

The Act provided for the re-organization of the railways in Great Britain by amalgamating them into four groups: (1) *Southern group* (London and South-Western; London, Brighton, and South Coast; South-Eastern and Chatham); (2) *Western group* (Great Western and the railway companies in S. Wales); (3) *North-Western, Midland, and West Scottish group* (London and North-Western; Midland; Lancashire and Yorkshire; North Staffordshire; Furness; Caledonian; Glasgow and South-Western; and Highland); and (4) *North-Eastern, Eastern, and East Scottish group* (North-Eastern; Great Central; Great Eastern; Great Northern; Hull and Barnsley; North British; and Great North of Scotland). In 1923 the grouping was brought

into effect, the sections being named Southern; Great Western; London, Midland, and Scottish; and London and North-Eastern. In addition to the constituent companies named, each group included a number of smaller subsidiary companies.

Public Ownership

On the outbreak of war in 1939 the railways, and also the London Passenger Transport Board (*see* London Transport), again passed under govt. control, which was continued after the cessation of hostilities. Under the Transport Act, 1947, inland transport (other than by air) and port facilities passed into public ownership. The Act established the British transport commission, consisting of a chairman and from four to eight other members of whom at least four were to be full-time members. Boards, known as executives, were established, to assist the commission to discharge its function of providing for the carriage of goods and passengers by rail, road, and canal, and the provision of dock facilities. On Jan. 1, 1948, all the main line railways and most of the smaller lines, as well as the London Passenger Transport Board, passed under the control of the commission. British transport stock to the value of some £1,065,000,000 was issued in compensation to railway and canal stockholders. In place of the four main-line railway company systems, the railways were divided into six regions: Scottish, North Eastern, Eastern, London Midland, Western, and Southern.

THE PERMANENT WAY. To transmit the pressure (which may be as much as 20 tons per sq. in.) from the small area of the wheel in contact with the hard steel rail to the comparatively soft earth which ultimately has to bear the weight, sleepers (to which the pressure is transmitted by the broad surface of the chair, sole-plate, or flat-bottomed rail, and so reduced to about 400 lb. per sq. in.) and ballast are used. The ballast serves the double purpose of spreading the weight over a great area and of holding the sleepers in line and to an even level. Ballast should be of hard angular material, such as broken stone, and the depth required depends on the nature of the soil. It must be porous, and there must be good drainage below it, so that water will not soak into and soften the foundation beneath.

Except in N. America, where weights on individual wheels up

to about 17 tons were permitted, the normal maximum wheel loads are generally restricted to 11 tons. To transmit the heavier loads to the ballast, the Americans use about 3,000 to 3,500 sleepers in their heaviest track to a mile of track; in Great Britain the number is normally 2,112. Wooden sleepers, impregnated with creosote as a deterrent of decay, are generally used. The timber used is softwood (*e.g.*, fir) or hardwood (*e.g.*, oak, jarrah, sal, teak), according to which happens to be more readily obtainable. Steel sleepers are much used on the European continent and in countries where wood is scarce or liable to rapid deterioration. A considerable mileage of the former Midi rly. of France (now part of the S.W. division of the French National rlys.) is carried on concrete sleepers. On the British railways timber shortage led to the testing of reinforced concrete sleepers on all the main lines, and many miles of track in sidings

check rails are added inside the lower rail to take part of the side thrust. Circular curves are now always, where possible, introduced by transition curves.

Steel rails are of two types, bull-head and flat-bottom. The former are carried in cast-iron chairs, the latter on cast-iron or steel sole-plates, or fixed directly to the sleepers by spikes or screws. They are usually fixed with an inward cant of about 1 in 20, the treads of the wheels being correspondingly coned when new. Rail ends are joined together by fishplates—or splice bars, as they are called in America. There is a tendency to use longer rails than formerly, and about 60 ft. is a usual length, though in Germany 30 metres (98 ft. 5 ins.) is standard. In England 120-ft. rails have been laid experimentally. The end-to-end welding of 45-ft. rails has become standard in New South Wales up to 360 ft. and in Victoria up to 225 ft. Since 1933 Delaware and Hudson Railroad of America has welded rails in open track into continuous lengths except where it is necessary to have breaks for junctions and track circuits. On the tube railways of London welded lengths of 300 ft. are standard. It is usual to lay the standard 95-lb. per yd. bull-head rails in 120 ft. welded lengths, and to weld them on the site into lengths not exceeding half a mile.

British and American Tracks

British track differs in design from that used in almost all other countries in the world, as bull-head rails are used, keyed in chairs, in preference to the flat-bottom rails favoured elsewhere. In the U.S.A., main-line flat-bottom sections range in weight from 110 lb. to 152 lb. per yd.; they are carried on heavy steel sleeper-plates, and are held down by a variety of fastenings to sleepers more closely spaced than is customary with the bull-head rail.

The first tests of flat-bottom rails in Great Britain were made on the L.M.S. rly. in 1936, and in 1939 that company laid the first British flat-bottom track in fast running main lines, with the 110 lb. per yd. British standard, and, later, the 131 lb. per yd. American railway engineering association (A.R.E.A.) standard rail, both of which have the same width of bottom flange. The L.M.S. rly. later adopted the new British 113 lb. rail. In 1943 the L.N.E. rly. initiated a similar large-scale experiment, entirely with the 110 lb. B.S. flat-bottom section,

Railways. Map showing the six regions system operated by British Railways; the boundary lines shown are as revised in 1950, two years after nationalisation

were laid with them. The average weight of a chaired and creosoted wooden sleeper is 237 lb.; that of a transverse ferro-concrete sleeper with two chairs and bolts is 550 lb.

For high-speed main lines curves are not normally made sharper than about half-a-mile radius, and are generally canted to a maximum of 6 ins. Speed is usually restricted on sharper curves. On curves of sharper radius than about 600 ft.,

Railways. Passenger trains on the Liverpool and Manchester Railway, opened in 1830. Top, mail train with first-class carriages; beneath, train with second-class and third-class carriages, with passengers completely exposed to the weather
From a print of 1833

and in Jan., 1944, installed the first experimental turnout with this rail. Early in 1946 the G. W. rly. decided to lay lengthy experimental sections with flat-bottom rails of the new British section of 113 lb. per yd., as well as 110 lb. On the Southern rly., also, 113 lb. flat-bottom rails were put into experimental use on lengthy sections of the main line.

The majority of the railways of the world are laid on the standard gauge of 4 ft. 8½ ins. as measured between the insides of the rails, but there are a number of other gauges in use. In India, Ceylon, Spain, Portugal, Argentina, and Chile the 5 ft. 6 ins. gauge is common; in Ireland, South Australia, Victoria, and Brazil the usual gauge is 5 ft. 3 ins.; in the U.S.S.R., 5 ft.; in a number of Australian states, New Zealand, S. and E. Africa, Gold Coast, Nigeria, Sudan, Japan, Sweden, and Norway, 3 ft. 6 ins.; and in some parts of Wales, India, and S. America, 1 ft. 11½ ins.

ROLLING STOCK. After the opening of the Liverpool and Manchester rly. in 1830, only first-class vehicles were enclosed to begin with, open thirds lasting until well into the 1850s, and even later on certain branch lines. From open four-wheelers, the railway carriage progressed through the stages of six-wheel enclosed and six-wheel corridors, introduced on the North-Eastern in 1833, to the bogie carriage of today, the first bogie vehicles in Great Britain being the five Pullmans put on the London-Bradford service by the Midland in 1874. These Pullmans were the pioneer buffet cars, but sleeping saloons ante-dated them by two years, being introduced almost simultaneously on the E. and W. coast routes to Scotland in 1873. In 1893 the afternoon express from King's Cross to Edinburgh was vestibuled throughout, the first example of what became universal main-line practice in Great Britain. Third-class diners appeared in 1891, third-class sleeping cars only in 1927.

After 1875, continuous brakes were fitted to British passenger stock, and the Act of 1889, which made such brakes compulsory, was merely intended to bring into line certain recalcitrant railways. Both the vacuum and Westinghouse systems are used. The principle of the vacuum brake is that any deliberate or accidental (e.g. through breaking of the couplings) admission of air at atmospheric pressure into the brake cylinders at once applies the brake blocks on the wheels. When running, the brakes are kept off by the use of a small ejector, which maintains a vacuum in the cylinders and train-pipe. After a stop, when the brakes must be quickly released, a longer and more powerful ejector on the locomotive sucks out the air in a few seconds. As the breaking force depends upon atmospheric pressure (14½ lb. per sq. in.), the cylinders must be very large. The Westinghouse type of brake works by compressed air at 50 to 90 lb./sq. in. pressure, and smaller cylinders suffice. An air-pump on the locomotive compresses the air into a reservoir, from which it is fed, by means of the driver's brake valve, through a triple valve to an auxiliary reservoir beneath each carriage. The valve is merely a three-way valve and when the movement of the driver's handle or the

pulling of a communication cord, or the breakage of the couplings, causes a drop in pressure in the train-pipe, the triple valve moves, and allows air from the auxiliary reservoir to pass to the brake cylinder and apply the blocks through the movement of the piston. Restoring the train-pipe pressure releases the brake.

Improvement in comfort and safety has been achieved only by increasing weight and cost. British main-line vehicles in the mid 20th century scale anything from 30

Railways. 1. Engine and coach of first train in the U.S.A., which ran from Albany to Schenectady, Aug. 3, 1831. 2. Metal railway ticket, Leicester and Swannington Rly., opened July 17, 1832. 3. to 35 tons; dining or sleeping cars are usually heavier. Dimensions and weight of typical standard passenger stock are:

	British	Continental	American
Length ..	61 ft. 6 ins.	68 ft. 3 ins.	78 ft. 0 ins.
Height ..	12 ft. 10 ins.	13 ft. 3 ins.	14 ft. 0 ins.
Width ..	9 ft. 3 ins.	9 ft. 7 ins.	10 ft. 4 ins.
Tare weight	30 tons	40 tons	70 tons

An American Pullman all-steel twelve-wheeled car, with 4 to 6 tons of air-conditioning equipment, may weigh complete from 80 to 85 English tons.

The development of passenger comfort in train travel during the 20th century has been very rapid, particularly in the U.S.A. An increasing number of passenger coaches are made of steel sheets, giving strength with lightness, and open lounge, library, bar, and buffet cars are a feature of luxury travel in the U.S.A. Sleeping cars

have been developed to give greater comfort and privacy, and smoking rooms, barbers' shops, bathrooms, typists' rooms, and observation cars giving wide vision of the country are to be found on many railways.

Freightwagons and vans are of many types and capacities. The majority of open wagons used in Great Britain are four-wheeled and are developments of the "wains" used 300 years ago in the colliery railroads. Covered wagons were subsequently introduced to protect goods from rain, snow, etc. The general carrying capacity is 10 to 12 tons, but as older wagons are condemned they are replaced by wagons of larger capacity and there are now many 16 ton wagons and a number of 20 ton wagons in the U.K. In the U.S.A. and

other countries 50 ton and larger wagons are common. Many special types of wagons have been developed to carry special traffic, e.g., oil, milk, bananas, fish; and heating and refrigerating plant is installed in them where necessary.

RACK RAILWAYS. On gradients exceeding 1 in 25 the ordinary kind

of adhesion locomotive is impracticable. Gradients up to 1 in 12 can be climbed, under favourable conditions, by trains of which all the wheels are driven. On steeper grades adhesion is insufficient, and a positive means of haulage is required, the most usual being that afforded by the engagement of driven cogwheels with a rack laid between the running rails and fixed firmly to the sleepers. The rack railway up Mt. Pilatus has an average gradient of 1 in 2½ and a maximum gradient of 1 in 2. This, however, is exceptional, 1 in 4 being generally considered the limit, above which cable haulage is to be preferred.

The racks used are of several kinds. The Strub is a single strong flat-footed rail with large teeth cut in the head, the Riggerbach has a single set of teeth shrouded on both sides; the Abt, two or

more sets so arranged that the teeth are in different lines transversely. The last gives the smoothest running, as at least two rack teeth are always engaged with a driving cog. Various devices are used to prevent the cogs from climbing the teeth of a rack. On very steep gradients the locomotive is always placed on the downhill side of the vehicles it has to move. Brakes act on the cog shafts, and work automatically if the speed exceeds a certain limit. Where electric power is available, it is preferred to steam.

Raimondi, MARC ANTONIO (c. 1475-1534). Italian engraver, also called Marcantonio. Born at

Bologna, he studied under Francia and later under Raphael at Rome. While in Venice, 1508-10, he copied on copper many of Dürer's woodcuts, which he signed with the

Raimondi,
Italian engraver

latter's mark; Dürer, however, obtained a prohibition against the continuance of this practice. Marcantonio's most famous plate is the engraving after Michelangelo's *The Climbers*; he also engraved after Raphael, Giulio Romano, and Baccio Bandinelli. After the sack of Rome in 1527 he fled to Bologna, where it is presumed that he died.

Rain. Condensed water vapour of the atmosphere falling in drops. When a mass of damp air rises and expands with decreasing pressure, its relative humidity increases until it is saturated; condensation then occurs on the numerous hygroscopic particles present in the atmosphere. If the temperature at this level is above freezing point a cloud of minute water droplets will be formed, which fall so slowly through the air that they can be regarded as in suspension. On further ascent of the air the droplets coalesce, and when they become sufficiently heavy to overcome the upward currents they fall through the cloud, gaining yet

more moisture. Beneath the cloud some evaporation will take place, but eventually the drops reach the ground as rain.

The formation of large raindrops has been attributed to coagulation brought about by collisions between droplets of different sizes (and therefore different relative motions), but another explanation depends upon the presence in the cloud of ice crystals as well as water drops. Then the crystals grow in size as they move downwards through layers of super-cooled water droplets. The great majority of raindrops have diameters of 2 millimetres or less. With a diameter beyond 5 mm. it is impossible for a raindrop to fall intact. See Condensation; Rainfall; Snow.

Rainbow. Name given to the phenomenon caused by the internal reflection and refraction of rays of light in the spherical globules of raindrops. A rainbow is always seen in the part of the sky away from the sun, its height varying inversely as that of the sun, i.e. the higher the position of the sun, the lower the rainbow. The colours of the rainbow are those of the spectrum in the same order, red being outside. Occasionally a second concentric and fainter bow is observed with the colours in the reverse order. Inside the main or primary bow one or two fainter "supernumerary" bows are sometimes visible. The intensity of the colours of a rainbow depends largely on the size of the raindrops. On mountain tops, or from an aeroplane, completely circular rainbows may be seen under favourable conditions. The lunar rainbow is a much rarer occurrence and appears white owing to the inability of the human eye to distinguish colour with weak light. In weather lore rainbows in the evening are regarded as precursors of fine weather

Rainbow. A second and even a third arc may appear if the light is strong
Dr. G. A. Clarke

er the following day, and in the morning of wet weather during the day. The Biblical story (Gen. 9) makes the rainbow the symbol of God's promise never again to inundate the world. See Clouds; Light; Spectroscopy.

Rainfall. General term for precipitation or condensation from the atmosphere, whether in the form of rain, hail, or snow, and to a lesser extent deposits of dew and hoar-frost. Estimates of rainfall are based upon measurements of the moisture collected in rain gauges exposed in such a manner as to be representative of the surrounding terrain. A rainfall of one inch in a certain time implies that if all the rain, or equivalent water, during that time had remained where it fell on a flat surface, suffering no loss by evaporation or percolation, it would form a layer one inch deep. The calculations of rainfall over the land masses of the globe and its variability from day to day, month to month, etc., depend upon measurements from rain gauges maintained by the various meteorological services, cooperating local authorities, and public-minded individuals; in the British Isles values are available each year for about 5,000 gauges constituting a fairly close network.

In addition to the regular official publications of summaries of these data, together with long-period monthly and annual averages, maps are issued showing the isohyets, or lines which indicate equal quantities of precipitation, for each particular month, season, and year. Over the E. and S. of the U.K. the rainiest month is generally Oct.; over the W. and N. it is Dec. or Jan. In some districts most rain falls in July or Aug. owing to the frequency of summer thunderstorms. For the country as a whole April is the driest month. As a rule, from any area of great rainfall the quantity diminishes towards the lowlands, deserts, and places more remote from the sea. Little information is available regarding the distribution of rainfall over sparsely populated areas, polar regions, and oceans.

Water vapour is always present in the atmosphere, warm air having a greater capacity for water vapour than cold air. The study of the causes of the formation of rain entails a study of the processes whereby air is cooled below its saturation temperature. This cooling may be brought about by direct radiation from the air itself, by warm moist air coming into con-

Rainfall. Map showing the distribution of the rainiest regions and the deserts of the world in relation to the season of maximum precipitation and the prevalent winds as indicated by arrows

tact with either a cold land or water surface, or by transportation by winds from warm to colder latitudes, e.g. the damp westerlies; but a large mass of air is cooled most rapidly by ascent, e.g. at a height of 3 m. the atmospheric pressure is only about half that at sea level, and a bulk of air raised to this altitude expands to twice its volume, the energy required to effect the movement of the molecules of air in this expansion being obtained at the expense of heat, which results in a fall of temperature, or adiabatic cooling.

When the temperature of the air is lowered sufficiently to cause condensation, the latent heat liberated counteracts adiabatic cooling to such an extent that, generally, air saturated with water vapour will have to ascend twice as high as unsaturated air if the same fall in temperature is to be achieved (5° F. per 1,000 ft. for dry air). This is an important factor in the production of heavy rain, because damp air which starts to rise, being warmer than its environment, will continue to rise higher than the dry air.

Three types of rainfall are recognized, according to the way in which adiabatic cooling leading to cloud formation is effected. *Convictional* rain is caused by the heating of surface layers of the atmosphere, heavily charged with moisture, which expand and rise, giving place to colder, denser air. Thun-

derstorm rains of summer afternoons are of this type, which is characterised by great intensity and comparatively short duration. Although the most severe storms are experienced in the tropics, rainfall rates in the British Isles occasionally reach 5 ins. per hour and in London have exceeded 10 ins. per hour over a minute or so.

Mountain ranges tend to deflect winds upwards, and if they are sufficiently moisture-laden the forced ascent produces persistent and widespread *orographic* rain. The cloudiness and heavy rainfall (exceeding 150 ins. per annum in some places) of the W. coast of Scotland are due to the westerly air streams having to rise over the steep W. slopes of the Highlands. The Pennines receive at least 10 ins. more rain a year than the valley of the Yorkshire Ouse. One of the most striking examples of orographic rainfall is provided in E. Assam—the wettest area on earth—where rapid ascent of the S.W. monsoon results from a converging system of ranges; at Cherrapunji (4,310 ft.), on the S. slopes of the Khasi Hills, more than 300 ins., on the average, is deposited between June and Sept., but at Shillong, 25 m. distant on the N. leeward slopes, the total for the same period is only 55 ins. Cherrapunji has recorded 900 ins. of rain in a year. The effect of the orientation of mountain ranges and hills upon the prevailing winds

accounts for the W. Ghats being rainier than the Deccan (the wet monsoon comes from the Arabian Sea) and British Columbia wetter than Alberta (the Rocky Mountains obstruct the westerlies).

Steady downpours associated with the passage of a depression are due to the vertical motion set up by an air mass rising over another air mass of different temperature. This rain is referred to as *cyclonic*. Although all these factors may contribute towards the rainfall of an area, in countries like the British Isles and Japan which lie in the tracks of depressions, a considerable proportion of the total amount, e.g. in autumn and winter in the English Midlands, is cyclonic in origin.

Rainfall is the complement of evaporation, a process continually in operation, especially at the surfaces of the oceans and the great seas. The complete cycle depends upon the carrying power of the winds to move the wet air from above the oceans landwards, and upon gravitation which forces the rainwater oceanwards. Winds from the sea are carriers of water vapour, and, in general, coastlands are rainier than inland areas. Exceptions occur for two reasons; first, the winds may blow always from the coast seawards, and secondly, the coastland may be so much warmer than the sea that the oceanic wind is not chilled but warmed at the coast. Then the

coasts are almost rainless; S.W. Africa has a coastland of the first type, and Sind of the second.

The chief rainfall regions of the globe are (a) equatorial, where the rainfall is mainly due to convection and occurs at all seasons but is heaviest at the equinoxes; (b) tropical (in the regions bounded by the equatorial belts and trade-wind deserts, e.g. Sudan and Rhodesia), where summer is wet and winter dry, the dry period being longer the farther from the Equator; (c) monsoonal (inside and outside the tropics, chiefly on the E. coasts of continents), where the contrast between wet and dry seasons is more pronounced owing to the seasonal changes in the prevailing winds; (d) westerlies (rainy zones polewards of the trade-wind belts), where there is precipitation throughout the year, mainly cyclonic in origin—in the interior of continents (e.g. Siberia and Manitoba) the summer rains, associated with thunderstorms, are the heaviest, but on the western seaboard (e.g. British Isles) and the islands in the open ocean (e.g. S. Island, New Zealand) the maximum occurs in autumn or winter and the minimum in spring; (e) Mediterranean (on the W. coasts of continents in sub-tropical latitudes, e.g. California and Cape Province, S. Africa), where summer is dry and winter the rainy season.

Most of the hot deserts (e.g. Sahara and Kalahari) are rainless because of the dry trade-winds which blow over them, while over cold deserts (e.g. Gobi) the temperature of the air is too low for the transportation of appreciable amounts of water vapour. In Antarctica and the interior of Greenland rain seldom falls, the precipitation being in the form of snow; Arctic Canada and Eurasia receive the bulk of their rainfall in summer and autumn.

The study of rainfall is of the greatest importance in connexion with the cultivation of a specific crop, e.g. regions suitable for growing cotton, tobacco, rice, and the different varieties of wheat are largely determined by the character of the rainfall. Failure of the monsoon rains in India and China may result in famine; in Queensland severe droughts caused the loss of 10 million sheep in three years. On the other hand, the notorious floods of the Yang-tse bing ruin and disaster to widespread areas. Planning irrigation schemes where the rainfall is either inadequate or unreliable, and providing reservoirs for the supply of

water to large centres of population are major economic projects.

Rainfall is intimately related to the main types of natural vegetation. Grass and scrublands (summer rains) are drier than forests. Winter rain regions have characteristic leathery-leaved trees and usually no grass. *See* Climate; Meteorology; Precipitation; Rain; Weather.

A. J. Drummond, F.R.Met.S.

Rain Gauge. Instrument used for measuring the fall of water, whether in the form of rain, hail, or snow. A funnel, usually 5 ins. or 8 ins. in diameter, catches the rain and leads it into a sunken collecting vessel consisting of a glass bottle resting inside a copper can. In the standard British pattern the funnel is deep with vertical sides to minimise errors due to splashing and to retain snow. The gauge is exposed with its rim 1 ft. above the ground in an open situation, the site being carefully chosen to ensure reliable results. At fixed times the precipitation is poured from the collecting vessel into a measuring glass, which is graduated to read very small amounts. The graduations record inches or mm. of rain, and depend upon the capacity of the measuring glass in relation to the superficial area of the funnel in which the rain is caught.

Many rain gauges are self-registering. In this type the collected rainfall generally is made to raise a float carrying a pen which traces a record on a chart wrapped round a clockwork-driven cylinder. When the limit of the chart is reached an automatic device returns the pen to the zero line, allowing the recording to continue. In countries where large snowfalls occur specially designed gauges are needed.

Rainham. A town of Essex, England. Built on a creek of the Thames, N.W. of Purfleet, about 12 m. E. of London, it has a rly. station on the Tilbury line. There is a notable church dating from the Norman period. Pop. 3,897. There is also a village of the same name in Kent, about 4 m. S.E. of Chatham, on the Dover road A2.

Rainier or **TACOMA.** Quiescent volcano in Washington, U.S.A. It is situated in the Cascade Range, alt. 14,408 ft. Fourteen glaciers lie around its summit, and dense woods clothe its lower sides. Its crater emits fumes, but no recent eruption has occurred, and the eroded slopes indicate that there has been none for a very considerable period.

Rain-making. Production of rain by mechanical or other means. Among primitive peoples many usages and rites are practised for the purpose. They may be mimetic, as with the Australian Arunta group, in which the members of the water-totem imitate a rising storm. In New Guinea, Africa, and America this is achieved by bull-roarers, which the Navaho make from lightning-riven pines, and the Zuni accompany by frothy decoctions simulating cloud.

In some African tribes the rain-maker is the local chief, using magical stones and spears of traditional sanctity. Animal sacrifice is observed by the Alikuyu with sheep and goats, and by the Buriat with horses. Some N. Indian forest-tribes immerse or sprinkle old people; in N. Africa a dressed-up ladle, ghanja, is carried in procession and sprinkled; the ceremonial immersion of saint-images survived into 19th century France.

Attempts to induce rain have included firing guns, and sowing "germs" from aircraft into certain types of clouds under favourable weather conditions. The latter method depends on the discovery that large numbers of tiny water-ice crystals form in air which is quickly cooled to very low temperatures. If small pellets of solid carbon dioxide at -80°C . are allowed to fall through an already cold cloud, the air in the cloud is further cooled with the production of billions of these crystals, which grow in size at the expense of the vapour molecules and the water droplets present in the cloud; eventually large snowflakes form and begin to fall, and once below the freezing level they thaw into raindrops. Rain has been artificially generated over limited areas in N. America and Australia in this way, but it sometimes evaporates before reaching the ground.

Rainy or **RÉNÉ.** Lake on the borders of Canada and U.S.A. It lies 155 m. W. of Lake Superior, and is about 50 m. long and from 3 m. to 8 m. broad. The outflow is past Fort Frances by the Rainy river into the Lake of the Woods. The frontier between Ontario and Minnesota follows the river and the lake's S. shore.

Rainy, ROBERT (1826-1906). Scottish divine. Born in Glasgow, Jan. 1, 1826, the son of a professor of medicine at the university, he was educated there. After training at New College, Edinburgh, he became a minister of the Free Church at Huntly in 1851, and in 1854 removed to one in Edin-

R. Rainy,
Scottish divine

burgh. In 1862 he was chosen professor of church history at New College, and in 1874 he became its principal. He resigned in 1900, and died at Melbourne, Dec. 22, 1906. Rainy was long the most prominent figure in his Church, and had a good deal to do with the union of the U.P. and Free Churches which became the United Free Church, of which body he was the first moderator.

Raipur. District and town of the Madhya Union, India, in the Chhattisgarh division. The district forms part of the Chhattisgarh plain in the upper Mahanadi valley. Only the W. of it is served by rlys., which radiate from the chief town. The rainfall is 49 ins., and rice and pulses are the chief crops. Area, 8,205 sq. m. The town has a valuable trade in cotton, grain, and lac, largely due to the Bombay - Nagpur - Calcutta rly. The walled fort was built in 1460. Pop. of the dist., 1,516,686; of the town, 63,465.

Raisin (Fr. from Lat. *racemus*, a cluster of grapes). Dried grape. It is used as a dessert fruit and in puddings, especially as a constituent of the Christmas plum pudding, the hard pips being extracted before use. Raisins are imported from France, Spain, and European and Asiatic Turkey (see Sultana). The ordinary raisin is made by drying in an oven, but the better sort, such as Muscatel raisins, are sun-dried, being left until thorough dried on the vine, the stem of the branch being half-cut through and the leaves removed. Seedless raisins are now common. See Australia; Grape.

Rait, ROBERT SANGSTER (1874-1936). Scottish historian. Born at Aberdeen, Feb. 10, 1874, he was educated at its university and New College, Oxford, being fellow of the latter from 1899. In 1913 he was made professor of Scottish history and literature at Glasgow and in 1929 principal and vice-chancellor of the university, having been Historiographer Royal for Scotland from 1919. Knighted 1933, he died May 25, 1936. Among his works are *The Scottish Parliament, 1901*; *Scotland, 1911*; *History of Scotland, 1914*; *The Parliaments of Scotland, 1924*; and he edited in 1901 the unpublished writings of James I.

Raj. Hindu word meaning rule. The British raj in India meant the British sovereignty. See India.

Raja. Indian title of honour meaning king. It has been given to rulers and others and sometimes hereditarily by the British government to Hindus. The feminine is ranee or rani.

Rajagopalachari, CHAKRAVARTY (b. 1879). Indian statesman. A Brahmin, he was born in Hosur, Madras, and educated at the central college of Bangalore, Presidency college, and the law college of Madras. Called to the bar in 1900, he became a successful barrister. He joined the non-cooperation movement in 1920, editing Gandhi's paper *Young India* during the latter's imprisonment. General secretary of the Indian national congress during 1921-22, he led its representatives in the Madras legislature, and was prime minister of Madras during 1937-39. The following year he was imprisoned under the Defence of India Act. Governor of the W. half of Bengal after the partition of 1947, he succeeded Lord Mountbatten as gov.-gen. of India in 1948-50, the only Indian to hold that office.

C. Rajagopalachari,
Indian statesman

Rajahmundry. Town of India, in Madras state. It is at the head of the delta of the Godavari, 30 m. from the sea and 365 m. N.N.E. of Madras on the rly. between Madras and Calcutta. The town was granted to the French in 1753 and evacuated by them in 1758, when it became British. It is an important river-crossing for road and rly. Pilgrims from the neighbourhood go to Benares, and carry away a pot of Ganges water; on their return to the bathing ghat here they empty half into the Godavari, then fill up the pot from it. Pop. approx. 74,500.

Rajasthan, UNION OF. Largest state of the Indian Union, composed of former Rajputana states. When formed in 1948, it comprised Banswara, Bundi, Dungarpur, Jhalawar, Kishangarh, Kotah, Parthagarh, Shahpura, Tonk, and Udaipur. As "Greater Rajasthan" it was joined in March, 1949, by Bikaner, Jaipur, Jodhpur, and Jaisalmer, and two months later by the Matsya union states of Alwar, Karauli, Dholpur, and Bharatpur. The capital of the

union is Jaipur. Rajasthan has an area of 140,000 sq. m. and a pop. (1950 est.) of 14,690,000.

Rajbansi (Hindustani, royal-born). Caste-name used by the hinduised Bengali-speaking section of the Koch people in N.E. India. Of some 2,000,000 persons, nine-tenths are in Bengal, the remainder in Assam, Bihar, and Orissa. Descendant from a Dravidian tribe in the Ganges basin at the Aryan immigration, they now claim Kshatriya ancestry, and imitate the Brahmanical rite in the marriage ceremony. See Koch.

Rajendralala Mitra (1824-91). Indian Orientalist. He was born in the neighbourhood of Calcutta, Feb. 15, 1824. In 1846 he was appointed librarian of the Asiatic Society of Bengal, of which he was vice-president, 1861-84, and then president till his death, July 26, 1891. He was made C.I.E. in 1878, and given the title of raja in 1888. One of the most profound Oriental scholars of modern times, his many works on historical, antiquarian, architectural, and religious subjects are of permanent importance. They include *The Antiquities of Orissa*, 2 vols., 1875 and 1880; *Bodhi Gaya*, 1878; and *Indo-Aryans*, 1881.

Rajk, LAZLO (b. 1909). Hungarian politician, tried for treason in 1949. See Hungary in N.V.

Rajkot. Town and former state of India, now in the Saurashtra union. Native food grains, sugarcane, and cotton are grown. The town is a rly. junction, and has a college for the education of sons of Kathiawar chiefs. Here was the residence of the political agent for E. Kathiawar. Area, 282 sq. m. Pop., state, 102,951; town, approx. 16,000.

Rajmahal. A town of Bihar, India, in the Santal Parganas. It is the terminus of a branch rly., situated on the Ganges, 65 m. N.W. of Murshidabad, and was formerly of considerable importance. The Rajmahal Hills form the extreme N.E. edge of the Deccan plateau; the Ganges bends S. round them. Pop. 8,200.

Rajpipla. Part of Bombay state, India, formerly the premier state in the Gujarat agency. Lying S. of the Narbada, with Baroda to N.W., it covers 1,517 sq. m. of fertile land with cotton crops and forests of teak. There is a rly. from Rajpipla, the capital, to Ankleswar. The maharaja, Sir Shri Vijaysinhji, who acceded in 1915, won the 1934 Derby with Windsor Lad. Pop. 249,032.

Rajpramukh (Skt., ruling chief). Constitutional head, equivalent of governor, of a state or union of states within the Indian Union. The title is usually given to one of the princes whose states have been merged into a larger unit. In each union of states there is also an up-rajpramukh (deputy), and Rajasthan has a maharajpramukh (principal).

Rajput (Skt., king's son). Mainly Hindu race in the N. of the Indian sub-continent between Sind and the Uttar union, belonging chiefly to the warrior caste. The area in which most of their states are situated is known as Rajputana (v.i.). In the times of the Moguls the Rajputs gave their daughters in marriage to the conquerors; but this was never done by the rulers of Udaipur, whose fortress of Chitor was three times sacked, the last time by Akbar in 1567. In memory of that disaster the ruler of Udaipur made a vow never to set foot in Delhi. The emperors Jehangir, Shahjehan, and Aurungzebe were the sons of Rajput princesses; the last in spite of his orthodoxy also took a Rajput bride. Only a small section embraced Islam, but the premier Sikh maharaja of Patiala traced his descent from the Rajput dynasty of Jaisalmer. A Rajput famous in England was K. S. Ranjitsinhji.

Rajputana. Geographical name of an area of N.W. India bounded by Bombay, the Punjab, the Uttar union, and Madhya Bharat. The Aravalli Mts. cross the region from N.E. to S.W.; the larger portion N.W. of the mts. is sandy and infertile, and forms on the W. the desert of Thar; the smaller area S.E. of the mts. is more elevated, rainier, and more fertile, and is drained by the Chambal and its tributaries. In the N.W. the people are nomadic, with herds of cattle, sheep, and camels; in the S.E. millet, oilseeds, wheat, and barley are grown. The Rajputs are Hindus who speak Rajasthani. Jaipur is the largest city. After the partition of British India most of the 23 Rajput states joined the union of Rajasthan (q.v.). Ajmer (q.v.) came under central govt.

Rajshahi. Former division and district of Bengal. In 1947 it was divided between India and Pakistan. The original div. stretched from the Padma distributary of the Ganges, W. of the Brahmaputra, to the frontier of Bhutan. The staple crop is paddy, but jute and oilseeds are also cultivated,

and the hemp of Rajshahi supplies all Bengal's requirements of the drug ganja. On June 12, 1897, the dist. was shaken by an earthquake which destroyed many public buildings. The East India Company took over the Zemindary of Rajshahi in 1765; it was reduced in size in 1793, and later by the formation of the Malda district in 1813, that of Bogra in 1821, and that of Pabna in 1832. Under partition the dist. of Rajshahi went to Pakistan, with Rangpur, Bogra, Pabna, and parts of Dinapur, Jalpaiguri, and Malda. Other parts of those three dists. went to India, which also took the Darjeeling dist. of the former Rajshahi div. The effect of partition was to give the Rajshahi div. of Pakistan an area of 13,488 sq. m. and pop. of 9,482,611. The territory assigned to India covers 6,154 sq. m. and has pop. 2,557,854. Of the dist. of Rajshahi, the area is 2,523 sq. m. and pop. 1,571,750.

Rakahanga. One of the Cook Islands, a dependency of New Zealand. It lies 25 m. N. of Manihiki and 670 m. N. of Rarotonga. It is an atoll, but the lagoon has no pearl shells. Copra is produced. Pop. 318.

Rake. Implement used for heaping loose material together, for smoothing the ground in connexion with sowing, for pulling out weeds, and other special purposes. Essentially a rake is a toothed bar attached at right angles to a handle. The teeth, or tines, are of wood in a light hay-rake, long but also wooden in a caving rake, and of steel wire in a general purpose rake, while couch-rakes for weeding have curved iron teeth, and heel-rakes long curved steel teeth. For work on a large scale a horse-rake is used. A cultivator is a rake with long, curved, barbed tines.

Rake. A nautical term to describe the backward, stern to stern, slope of a ship's masts or funnels; also the backward slope of the stern by as much as it overhangs the keel. When a mast inclines towards the bow, like the foremast of the Spanish galleon, it is said to have a fore-rake. A rakish ship indicates a vessel having fast lines but an undisciplined appearance. Raking fire is when guns enfilade a ship, or sweep it in the direction of its length. In architecture the rake of a roof is its slope or pitch; in the theatre the rake of a stage is its inclination from level; and in mining a rake is a vertical or highly inclined rent or fissure in the strata.

Rake's Progress, THE. Series of eight pictures by Hogarth (in the Soane Museum, London). It was painted after the artist had established his reputation in 1734 with the series of *The Harlot's Progress*. The rake is a young man of fashion who plunges into debauchery, seeks to recuperate his waning fortune by gambling, is imprisoned for debt, and finally ends his days in a lunatic asylum. A ballet in six scenes based on the Hogarth series, with music by Gavin Gordon, choreography by Ninette de Valois, and décor by Rex Whistler, was produced at Sadler's Wells in 1935. The word rake in this connexion comes from the 16th century phrase rake-hell.

Rakoczy OR RAGOTSKY, GEORGE (1591-1648). Prince of Transylvania. The son of Sigismund Rakoczy, a Hungarian magnate, he was elected prince of Transylvania in 1631. In 1643 he allied himself with the Swedes and the French, and roused Hungary against Austria with the intention of making himself king of Hungary. When his army was close on Pressburg (now Bratislava) he was compelled, by the intervention of the Turks, to conclude an armistice, on which peace soon followed. As a reward for abandoning his pretensions, Rakoczy received the hereditary dignity of a prince of the empire and seven Hungarian counties. He died Oct. 24, 1648.

Rakoczy's son, George (1621-60), became prince of Transylvania. He fought against the Poles and was deposed, being killed whilst resisting the Turks. His only son, Francis (1645-76), was prince for a short time, and the latter's son, Francis (1676-1735), became, owing to his wealth and descent, the leader of the Magyars in their rising against the rule of the Hapsburgs.

Raleigh. City of North Carolina, U.S.A., the state cap. and the co. seat of Wake co. It is 205 m. N.E. of Columbia, and is served by the Southern and other rlys. An important educational centre, it is the site of Shaw university, and contains the state college of agriculture and mechanical arts, and colleges for women and coloured students. Among the products are cotton goods, hosiery, agricultural implements, boilers, and stationery. Raleigh is an early example of town planning, the ground plan of the city having been adopted by the state convention in 1792. The city was named in honour of Sir Walter Raleigh. Pop. 46,897.

Raleigh, CECIL. Pseudonym of Cecil Rowlands (1856–1914), British playwright. He wrote Drury Lane melodramas, either in collaboration with R. C. Carton, Augustus Harris, Henry Hamilton, and G. R. Sims, or alone. Three of his best were *The Sins of Society*, 1907; *The Whip*, 1909; *Sealed Orders*, 1913. He died Nov. 10, 1914.

Raleigh OR **RALEIGH, SIR WALTER** (c. 1552–1618). English soldier, sailor, courtier, and writer. He was born at Hayes Barton, near Budleigh Salterton, Devon, and educated at Oriel College, Oxford. After service with the Huguenots in France and the Netherlands, 1569–78, he went on a voyage of discovery with his half-brother, Sir Humphrey Gilbert, reaching the West Indies. He next took part in the suppression of Desmond's rebellion in Ireland, where later he was granted large tracts of confiscated land in Munster, acquired the famous house known as Myrtle Grove at Youghal, and built another house at Lismore. He appeared at the English court in 1581, and became a prime favourite with Elizabeth, who knighted him in 1584. For the story that he first gained the queen's favour by placing his cloak over a muddy pool in her path there is no earlier authority than Fuller's *Worthies of England*, 1662.

In 1578 and 1583 Raleigh was associated with the unsuccessful attempts of Gilbert to plant a colony in N. America. Gilbert was lost at sea, 1583, but next year Raleigh, though not permitted to go himself, fitted out an expedition which planted itself in what is now known as North Carolina, probably on the island of Roanoke. Raleigh called the colony Virginia, a name given for many years to the whole seaboard from Florida to Newfoundland. Other expeditions followed in successive years, one under Raleigh's cousin Sir Richard Grenville, and from Virginia tobacco and potatoes were first introduced into England and Ireland. The patent granted to Raleigh in 1584 lapsed to the crown in 1603, and the realization of his dream of a Greater England overseas was postponed until he was a prisoner in the Tower and the idea was taken up by others as a commercial enterprise.

Appointed vice-admiral of Devon and Cornwall, 1585, Raleigh helped to draw up a plan of defence against invasion in 1588, but it is doubtful if he took any personal part in the fight with the Spanish Armada.

Meanwhile Essex, with whom he quarrelled, superseded him in the queen's favour, and he was committed to the Tower in 1592 for an intrigue with Elizabeth Throgmorton, one of the queen's maids of honour, his subsequent marriage to whom caused him to be ostracised from court. M.P. for Michael, Cornwall, 1593, he made his famous voyage to the Orinoco in quest of El Eldorado in 1595, and in 1596, being restored to favour, he took a leading part, with Essex, in the Cadiz expedition, and distinguished himself at the Azores in 1597. M.P. for Dorset, 1597, and for Cornwall, 1601, in 1600–03 he was governor of Jersey.

On the accession of James I, 1603, Raleigh was charged with plotting against the new king and favouring the cause of Arabella Stuart. After a scandalously unfair trial he was found guilty and condemned to death. Reprieved on the scaffold, he was sent to the Bloody Tower, where, with his wife and son, he lived until Jan. 30, 1616. Then he was released to lead another expedition to the Orinoco, promising the king not to interfere with Spanish settlements. The expedition left England in 1617, and as was inevitable it came into collision with the Spaniards, its leader's son being slain. Raleigh returned, and his punishment being demanded by the Spanish minister, he was arrested. Bacon, the lord chancellor, acquiescing, he was arraigned on the old charge of treason, and executed in Old Palace Yard, Westminster, Oct. 29, 1618, his remains being interred in St. Margaret's.

Raleigh was the incarnation of the spirit of the Elizabethan era. As courtier, soldier, sailor, politi-

cian, poet, historian, chemist, he took rank among the foremost of his fellows. He was the pioneer of British colonial empire. A friend of Spenser, who called him Shepherd of the Ocean, he secured royal favour for the publication of *The Faerie Queene*. Raleigh was also a crony of Marlowe, and the foundation of the Mermaid Club (*q.v.*), in Friday Street, is attributed to him. His career was always exciting, but often sordid; he was as much pirate as explorer, and as ready to patronise the quack as the genius. His career affected history only slightly.

Raleigh's books include *The Last Fight of the Revenge*, 1591; *The Discovery of Guiana*, 1596; *Relation of Cadiz Action*, first printed 1805; *History of the World* (to the second Macedonian War), 1614, in which he was assisted by Jonson and other scholars, a work written in the Tower, and ending with the celebrated apostrophe to death; *The Prerogative of Parliaments*; *The Cabinet Council*; *Discourse of War*; *Apology for the Voyage to Guiana*. His most notable verses are *The Pilgrimage*; *The Lie*; *Reply to Marlowe's Come Live With Me and Be My Love*; *Even Such Is Time*.

Bibliography. Works, 8 vols., with Lives by Oldys and Birch, 1829; Poems, ed. J. Hannah, 1892; Lives, E. Gosse, 1886; W. Stebbing, new ed. 1899; J. R. Rodd, 1904; H. de Selincourt, 1903; M. A. S. Hume, new ed. 1926; E. Thompson, 1935; R. Waldman, new ed. 1943; Sir W. R. in Ireland, Sir J. P. Hennessy, 1883; *State Trials*, ed. H. L. Stephen, 1899; R.'s *Last Voyage*. V. T. Harlow, 1932; R. and His World, I. Anthony, 1934.

Raleigh, SIR WALTER (1861–1922). English scholar. A Londoner and the son of a Congregational minister, he was born Sept. 6, 1861. He went to University College, London, and King's, Cambridge, and was professor of modern literature at Liverpool; of English literature at Glasgow from 1890; and of the same subject at Oxford from 1904 until his death on May 13, 1922. In 1911 he was knighted. He wrote *The English Novel*, 1894; *Style*, 1897; *Romance*, 1917; and appraisals of Stevenson, Milton, Wordsworth, and Shakespeare; was responsible for the first volume of *History of the War in the Air*; and in light vein threw off the lines written at a garden party, beginning "I wish I loved the human race."

Raleigh Bay. Broad bay off the S.E. coast of North Carolina, U.S.A. Formed by long, narrow

sand dunes, it stretches from Cape Hatteras in the N.E. to Cape Lookout in the S.W., and communicates with Pamlico Sound through Ocracoke Inlet.

Rallentando. Musical term. Of Italian origin, it signifies gradually decreasing the speed of music, most frequently at the end of a piece or of an important section thereof, but also employed towards the close of a phrase and in other places. A similar term is *Ritardando*.

Ralph Roister Doister. Early English comedy. Written by Nicholas Udall (*q.v.*), and first produced about 1551 at Westminster school, where it was revived in 1921, Ralph Roister Doister is based on the *Miles Gloriosus* of Plautus. The plot concerns the unsuccessful wooing by the vain-glorious Ralph of the wealthy widow Dame Christian Custance. Matthew Merygreeke, the fun-loving and good-natured friend of Ralph, is Udall's own creation.

Ram. This device used in hydraulic power installations is described under Pump.

Ram. Projecting forefoot or lower portion of a ship's stem below the water-line. It was formerly fitted to the bow of a warship in order to sink an enemy vessel when driven into it. The ram was introduced by the Phoenicians as a large metal trident, with two prongs above water and one below, fitted to an oared galley. It was adopted for English warships in the third crusade and developed into an effective weapon, being the only means of destroying an enemy ship, except by boarding or fire, until the introduction of cannon. With the development of the sailing warship the ram was abolished, but was revived for steam warships after the successes of the Confederate vessel *Merrimac* in ramming Federal ships in the American Civil War. On July 20, 1866, the Austrian battleship *Ferdinand Max* rammed and sank the Italian battleship *Re d'Italia* at Lissa. Until the end of the 19th cent. the underwater stem of every battleship was built in the form of a ram, but experience proved this device almost as dangerous to the rammer as to the rammed. There have been disasters through accidental ramming by warships: the *Vanguard* was sunk by the *Iron Duke*, Sept. 1, 1875; the *Grösser Kurfürst* by the *König Wilhelm*, May 31, 1878; the *Victoria* by the *Camperdown*, June 22, 1893. In both Great Wars warships and merchantmen used

their bows for ramming in favourable circumstances, particularly against the thin hulls of submarines. On April 8, 1940, the British destroyer *Glow-worm* attempted to sink by ramming the German cruiser *Hipper*.

Rama IX. Name taken at his coronation, 1950, by Phumibol Aduldet (*q.v.*), king of Siam.

Ramadan. Ninth month of the Mahomedan year (in May-June). Sanctified as the month in which the Koran was revealed to the Prophet, it is kept as a strict fast, no food, smoking, or any form of self-gratification being permitted on any day between dawn and sunset. In addition there are many extra devotional practices, especially during the last ten days.

Ramadie. Town of Iraq. On the Euphrates, it is 59½ m. W. by N. of Bagdad. The battle of Ramadie was fought between the British and the Turks, Sept. 28-29, 1917. On Sept. 26 General Maude concentrated a force for its capture. The place was strongly held, but, by means of a flanking movement, the Turks were forced to surrender on Sept. 29.

Ramadier, PAUL (b. 1888). French statesman. Born at La Rochelle, he was educated at Toulouse and Paris universities. After serving in the First Great War, in 1919 he entered politics as mayor of the Socialist centre of Decazeville.

Paul Ramadier, French statesman

A brilliant lawyer, he was under-secretary for public works in Léon Blum's government during 1936-37, and minister of labour under the Daladier and Chautemps coalitions, 1937-38. After the Franco-German armistice, 1940, he retired from public life, and played an active role in the resistance movement. In Nov., 1944, he joined de Gaulle's govt. as minister of food, was minister of justice in Blum's "caretaker" govt., and in Jan., 1947, became premier, resigning in Nov. when the measures he proposed to overcome financial and industrial difficulties failed to avert serious civil disturbances.

Ramah. Name meaning a height, and used in the Bible for a number of places which are difficult to identify. One was the site of Rachel's tomb. The modern Er Ram (Ramah), E. of the Nablus

road, and 6 m. N. of Jerusalem, was associated with the life of the prophet Samuel, and figured in the wars between the ten tribes and the tribe of Judah.

Raman, SIR CHANDRASEKHARA VENKATA (b. 1888). Indian physicist. He was born Nov. 7, 1888, and educated at Presidency College, Madras. After holding various research posts in India, the U.K., and the U.S.A., he was professor of physics at Calcutta university from 1917 to 1933. Raman was elected president of the Indian academy of sciences in 1934. He studied specially the properties of light, discovering in 1928 the Raman effect, for which he was awarded the Nobel prize for physics in 1930. Later he became head of the Raman research institute at Bangalore, set up to study the problems which had long been his speciality. Raman wrote many books, most of them on light, some on the physical aspects of music, e.g. *Mechanical Theory of Bowed Strings and Violin Tone*; *Theory of Musical Instruments*.

The Raman effect is concerned with the scattering of light by a liquid carefully freed from any suspended particles. The scattered spectrum contains lines additional to those in the incident light. Thus, if γ_0 is the frequency of a primary spectral line, it gives rise to frequencies $(\gamma_0 + \gamma_R)$ and $(\gamma_0 - \gamma_R)$ when γ_R is the characteristic Raman frequency of the liquid. It is, in fact, the fundamental vibrational frequency of the liquid molecules.

Ramayana. One of the two great epics of ancient India, *Mahabharata* being the other. Described as the Indian *Odyssey*, it tells of the wanderings and adventures of Rama, a prince banished from his country. The period, about 1000 B.C., is regarded as the Golden Age of India, the period of the Kosalas, to whom Rama belonged, and the Videhas, from whom came his devoted wife Sita. Rama and Sita are the Hindu ideals of perfect man and perfect woman. The poem, dating from some unknown time, and attributed to one Valmiki, has been added to again and again until it consists of 48,000 lines. An Italian edition and translation, 1843-67, first made it known to European readers. A large part of it was published in English verse by Ralph Griffith, 1868-74, and a prose translation has been issued at Calcutta. A condensed translation in verse is by Romesh Dutt, 1899. Consult *The Indian Epics*, J. C. Oman, new ed., 1899.

Rambert, MARIE. Polish-born British dancer and teacher. Born at Warsaw, she studied there, and appeared with the Diaghilev company during 1912-14. She founded her own company in 1926, and helped to initiate the Camargo Society which presented ballet in the early 1930s. She founded a ballet school at the Mercury Theatre, London, where she directed the Ballet Rambert. From 1942 she worked in conjunction with the Arts Council. The many famous dancers whom she trained included Pearl Argyle, Frederick Ashton, Harold Turner, Sally Gilmour, and Walter Gore. She married Ashley Dukes (*q.v.*). See Ballet.

Rambler. Name given to a group of climbing roses. The crimson Rambler, a hybrid between *Rosa wichuraiana* and *R. multiflora*, was the first of the kind cultivated. Single and double varieties of many colours are now grown. They have dense clusters of small flowers and are good pergola plants. See Rose.

Rambler, THE. Periodical issued by Dr. Johnson during 1750-52. A series of moral and religious essays, although at times stilted in style and sentiment, they acquired great popularity, and were mainly responsible for Johnson's reputation among his contemporaries. Published by Cave, the Ramblers appeared every Tuesday and Saturday between March 20, 1750, and March 14, 1752. They were all written by Johnson except Nos. 10, Mrs. Chapone; 30, Miss Catherine Talbot; 97, Samuel Richardson; 44 and 100, Elizabeth Carter. See Johnson, Samuel.

Rambouillet, CHATEAU DE. Palace at Rambouillet, dept. of Seine-et-Oise, France. Now used as the summer residence of the president of the French Republic, it lies 30 m. by rly. S.W. of Paris. The château has magnificent parks and gardens laid out by Lenôtre, and an interesting dairy built by Louis XVI. In the château Francis I died in 1547, and Charles X signed his abdication in 1830. It passed into the possession of the nation at the Revolution.

Rambouillet, CATHERINE DE VIVONNE, MARQUISE DE (1588-1665). French lady. Born at Rome of an aristocratic Roman family, she married the marquis de Rambouillet in 1600, and, as mistress of

the famous Hôtel Rambouillet, in the rue St. Thomas-du-Louvre, Paris, became from about 1608 onwards the centre of a social and intellectual circle unrivalled in its day. She died Dec. 2, 1665. Her daughter Julie (1607-71) married the duc de Montausier, 1645, and was also a woman of high intellectual attainments.

Rambutan (*Nephelium lappaceum*). Tree of the family Sapindaceae. It is a native of Malaya, and bears a bright red, oval fruit, closely related to the litchi nut. See Litchi.

Rameau, JEAN PHILIPPE (1683-1764). French composer. Born at Dijon, Oct. 25, 1683, he became a church organist in Lille and Clermont-Ferrand before settling in Paris in 1722. He immediately attracted attention by his treatise on harmony, and the next year one of his lighter pieces was mounted at the Opéra Comique. His opera Hippolyte et Aricie was played at the Opéra, 1733, the first of a score, notable among which was *Castor et Pollux*, 1737. He published other important works on musical theory, *e.g.* his *Démonstration du Principe de l'Harmonie*, 1750. His harmonic theories, especially his ideas on chord-building by thirds and on the fundamental bass, profoundly influenced musical development in the 18th century. He died in Paris, Sept. 12, 1764. See Lives, A. Pougin, 1876; L. Laloy, 1908.

Ramée, MARIE LOUISE DE LA. British novelist who used the pseudonym of Ouida (*q.v.*).
Rameses or **RAMESSU.** Name of two Egyptian kings of the XIXth and of nine of the XXth dynasty. Rameses II, styled the Great, and long reputed to be the Pharaoh of the Oppression, reigned for 67 years from about 1300 B.C. He waged tedious wars against the Hittites, which resulted in his 21st year in a treaty preserved in a hieroglyphic version at Karnak, and in cuneiform on a tablet that was found at Boghazköi in 1907.

The greatest of Egyptian builders, one half of the temples still extant date from

his reign, and his name or portrait occurs in nearly every great group of ruins. His finest statue is at Turin. Near the Theban Ramesseum are the remains of a statue estimated to have weighed 1,000 tons; the colossal head of another was removed to the British Museum. His mummy is at Cairo. See Abu-Simbel; Karnak; Luxor; Memphis; Pentaaur; Sesostris.

Rameses III. King of Egypt. The Rhampsinitus of Herodotus, and the virtual founder of the

Rameses III, King of Egypt
Head of the mummy in
Cairo Museum

XXth dynasty, he reigned for 32 years from about 1200 B.C. He undertook several defensive campaigns, used naval craft in the Mediterranean, and came into conflict with the Philistines. His majestic Theban temple at Medinet Habu, together with the great Harris papyrus in the British Museum—133 ft. in length, the longest known—record his military achievements and opulent temple-gifts. His tomb, 400 ft. long, discovered by James Bruce, contained a sarcophagus now in Paris, the lid being at Cambridge. His mummy is at Cairo.

Rameswaram. Town and island of Madras state, India, in Ramnad dist. The island is 18 m. long and stretches S.E. towards Ceylon at the head of the Gulf of Manaar; from it Adam's Bridge (*q.v.*) reaches towards Ceylon. The rly. from Madura runs across the island through the town to the S.E. tip. Bêche-de-mer is obtained in neighbouring waters. In the town is a gate-tower temple with corridors 4,000 ft. long, visited annually by crowds of pilgrims. Pop. 15,500.

Ramie. Bast fibre of a stingless nettle, *Boehmeria tenacissima* or *B. nivea*, also known as rhea and China grass. The latter name is given to fibre hand-cleaned from the bark in China, and fine native cloth hand-made from long unspun

Rameses II
Head of the mummy in
Cairo Museum

fibres thus derived is sold as grass cloth. The fibre comes to Europe from China, Malaya, and the

Ramie fibres, magnified about 10 times

Indian sub-continent in the form of dried ribbons with the bark adherent, stripped from the stem and containing a strong insoluble gum or resin. This last having been decomposed, ramie can be card-

ed or combed and spun upon worsted or flax machinery. The yarn has great tensile strength, but is so brittle as to snap easily at a knot. The fibre is heavy but inflammable, does not contract when wetted, and is short of elasticity. Almost all incandescent gas mantles are made from ramie, as the ash of the fabric does not shrink like cotton upon burning. An artificial straw for hats is made by agglutinating parallel fibres into a ribbon. The fibre is extensively used in making cordage, nets, and paper for banknotes.

Ramillies, BATTLE OF. British and Dutch victory over the French, Whitsunday, May 23, 1706. Ramillies is in the Belgian prov. of Brabant, 12 m. N. of Namur. The War of the Spanish Succession was raging, and, prevented by the Dutch from marching into Italy, Marlborough turned against the French, who had one army under Villeroi on the borders of the Netherlands, and behind it another under Marsin. These proposed to unite, but before they had done so Marlborough, having divined the plan, reached Ramillies and offered battle. Villeroi did not wait for Marsin's main army.

The French army was arranged with the artillery in the centre, protected by infantry with cavalry on the wings. Marshy ground was on their left, where flowed the Little Gheet river, while their right was protected by two small villages which they held. They were faced by the English and Dutch, infantry in the centre and cavalry on the flanks. The encounter opened with an attack by the English and Dutch on the French left, the troops wading rather than marching to the assault. Ramillies itself was also assailed, but in vain, and the reply was the rout of some Dutch cavalry. Encounters between the

horsemen, a contingent of Danes being on the English side, ended in the discomfiture of the French.

Meanwhile Marlborough had made movements that decided the day. Having assaulted Franquenay the Dutch infantry stormed Taviars, the other village held by the French, but the decisive stroke was effected when the English centre was strengthened. Charging forward, the infantry there broke through the French line about Ramillies. The Dutch had turned the right, so the enemy broke and fled. Nearly all the French artillery was captured, and they lost about 15,000 in killed, wounded, and prisoners. English and Dutch losses were under 4,000.

Ramleh. Town of Palestine. It is 22 m. W.N.W. of Jerusalem on the main road to Jaffa, with a branch to Ludd, and on the rly. from Jerusalem to both those places. The chief mosque was originally a church built by crusaders. Ramleh was occupied by the British in 1917. Population est. 15,160.

Rammekens. Fortress on Walcheren Island, Netherlands. Situated on the dykes 3 m. E. of Flushing, it formed part of the defences covering the entrance to that port. During Allied operations in the Second Great War to free the Scheldt estuary and open the port of Antwerp, Rammekens was attacked by the R.A.F. on Oct. 7, 1944, the dykes were breached, and the Germans in the area were marooned by the resulting floods. In Sept.-Oct., 1945, the breaches were filled with concrete Phoenix caissons, some of them raised from Mulberry Harbour (*q.v.*).

Ramnagar. District and town of Madras state, India. The district lies inland from Palk Bay and the Gulf of Manaar, and is drained by the Vaigai river, alongside which runs the rly. from Madura to Rameswaram Island. The chief crops are rice, native food grains, pulses, and cotton. The town contains the palace of the raja of Ramnad, whose title of Setupati means Lord of the Bridge, i.e. Adam's Bridge. Area of dist., 4,851 sq. m. Pop., dist., 1,979,643; town, 21,400.

Ramnagar. Town of the Uttar union, India, in Benares dist. It is situated on the right bank of the Ganges, almost opposite Benares. It contains the palace of the maharaja of that city.

Ramon, GASTON (b. 1886). French bacteriologist. He attended the lycée de Sens and the veterinary school at Alfort, and in

1911 entered the Pasteur institute in Paris, of which he was successively assistant chief of laboratories, head of the research department, and assistant director. The anatoxines he devised for vaccination against diphtheria and tetanus were universally adopted, as several immunities could be achieved with a single operation.

Ramón y Cajal, SANTIAGO (1852-1934). Spanish neurologist, born May 1, 1852. Graduating from Saragossa in 1873, eight years later he became professor of anatomy at Valencia, and in 1886 professor of histology at Barcelona. Transferring thence to Madrid in 1892, he earned a world-wide reputation by his researches, receiving half the Nobel prize for medicine in 1906. He wrote extensively in French and Spanish. He retired in 1922 and died in Madrid, Oct. 18, 1934.

Ramoth-Gilead. Name signifying the heights of Gilead (*q.v.*), where Ahab was slain (2 Chron. 18); also a city of refuge (*q.v.*).

Rampant. Term in heraldry. A four-footed beast or monster, represented as standing on its hind

Rampant in heraldry

legs, pawing the air, and with jaws open, is said to be rampant. But a horse in this position is often described as *forcené*, or *efrené*, the nostrils being dilated, and the eyes of a different tincture from that of the body, and so said to be *animé*. See Heraldry.

Rampart. Wall of defence used either in permanent or in field fortification. Ancient and medieval forts had a wall of masonry strong enough to resist a battering ram for a long time, and broad enough to form a platform for the defenders, from which they could discharge missiles. In field works a rampart is usually a bank of earth, sometimes supported by masonry; it is generally protected in modern warfare by sandbags. See Castle; Givet illus.

Rampion

(*Campanula rapunculid*). Perennial herb belonging to the family Campanulaceae. It is a native of Europe, W. Siberia, and N. Africa. It has a thick, fleshy root. The lower leaves are

Rampion flowers

stalked and oval, the upper stalkless and very slender. The blue flowers are much like those of the harebell (*C. rotundifolia*), but form a many-flowered, long spray. The root is edible, and the plant is frequently cultivated for its sake.

Rampur. Town and former state of India; the state is now merged in the Uttar union. The former state is situated adjacent to the Himalayan foothills, with Moradabad dist. on the W., and Bareilly dist. on the E. The town is on the rly. between Moradabad and Bareilly; it has manufactures of pottery and jewelry. Area, 893 sq. m. Pop., state, 464,919; town, 89,322.

Rampur-Boalia OR RAJSHAHI. Town of E. Bengal, Pakistan, in Rajshahi dist. On the right bank of the Padma distributary of the Ganges, it is the district headquarters. It contains a college and an old Dutch trading factory. Pop. 40,778.

Ramsay, ALLAN (1686-1758). Scottish poet. Born Oct. 15, 1686, at Leadhills, in Lanarkshire, he

Allan Ramsay,
Scottish poet

started his career as a wig maker. He collected and rewrote old Scottish songs and ballads, which were published in 1724 as *The Tea Table Miscellany* and *The Evergreen*. In 1725 he published *The Gentle Shepherd*, a pastoral containing admirable descriptions of rural scenery and marked by genuine poetic feeling. In Edinburgh, in 1726, he opened a bookseller's shop which became a resort for literary figures of the capital, and the centre of a circulating library. He died in Edinburgh, Jan. 7, 1758. Ramsay cannot be regarded as a great poet, and he has a strong vein of coarseness, yet he was a distinct factor in the return to nature, which was to have such full expression a generation or two later. Burns and Scott found inspiration in his work. Consult Allan Ramsay, W. H. O. Smeaton, 1896.

Ramsay, ALLAN (1713-84). Scottish painter. Son of Allan Ramsay, the poet (v.s.), he was born in Edinburgh, and began his art studies in London in 1733. He went to Rome to study further in 1736, and returned to Edinburgh in 1739 and started his career as a portrait painter. About 1757 he came to London, and soon established his reputation by his sound,

if somewhat undistinguished, portraiture; among his sitters were George III and Queen Charlotte, Flora Macdonald, Chesterfield, Hume, Gibbon, and Rousseau. A friend of Johnson, he was well known in intellectual society. He acquired a considerable fortune, spent some years in Italy, and died at Dover, Aug. 10, 1784. Examples of his work are in the National Portrait Galleries in London and Edinburgh.

Ramsay, ARCHIBALD HENRY MAULE. Contemporary British politician. Educated at Eton and Sandhurst, he was commissioned in the Coldstream Guards in 1913, and served in the First Great War. He was Conservative M.P. for Peebles during 1931-45. President of the Right Club, and a member of the British Union of Fascists, he was arrested in 1940 under regulation 18B, and detained at Brixton prison until 1944.

Ramsay, SIR BERTRAM HOME (1883-1945). British sailor. He entered the navy in 1898, and came

into prominence in the First Great War, becoming commander in 1915, and serving with the Dover patrol 1915-19. Flag commander to Jellicoe in 1919, he later joined the staff of the R.N. war college, and commanded H.M.S. Royal Sovereign during 1933-35, when he was promoted to flag rank. He then became chief of staff to Sir Roger Backhouse, and retired in 1938 with the rank of vice-admiral. At the outbreak of the Second Great War he rejoined, and commanded at Dover, being responsible for carrying out the withdrawal of the British army from Dunkirk in 1940, an achievement for which he was knighted. In 1942 he planned the amphibious operations of the Allied landings in N. Africa, and in 1943 those in Sicily and Italy, where he took command. For the greater operation of D-day, 1944, Ramsay was the obvious choice for the naval command. He was killed in a flying accident in France, Jan. 2, 1945.

Ramsay, EDWARD BANNERMAN BURNETT (1793-1872). Scottish author and divine, born at Aberdeen, Jan. 31, 1793. Educated at Durham and S. John's College, Cambridge, he was ordained in the Church of England, and from 1816 to 1824 was a curate in Somerset.

Then he obtained a living in Edinburgh, and in 1830 was appointed incumbent of S. John's church there. Ramsay was dean of Edinburgh in 1846, and until his death was one of the leading figures in the episcopal church in Scotland. He died Dec. 27, 1872. Ramsay's fame rests chiefly upon his *Reminiscences of Scottish Life and Character*, 1858, based on two lectures delivered in Edinburgh in 1857. It is an admirable collection of Scottish stories, often typically humorous.

Ramsay, SIR WILLIAM (1852-1916). British chemist. Born in Glasgow, Oct. 2, 1852, and educated at Glas-

Sir William Ramsay,
British chemist

gow university, he afterwards took courses at the universities of Heidelberg under Bunsen, and Tübingen under Fittig. In 1880 he was appointed professor of chemistry at the then University College, Bristol, and became principal in 1881. He remained at Bristol until 1887, when he became professor of chemistry at University College, London, holding that post until his retirement in 1912. Knighted in 1902, in 1904 he received the Nobel prize for chemistry.

Ramsay's earliest work was in physics; his researches were directed to chemistry by a request from Rayleigh that he would investigate the reason for the difference in the density of nitrogen prepared from the air and by chemical means. This research resulted in the discovery that the nitrogen from the air contains a new element, argon. Searching for other sources of argon, Ramsay discovered in a mineral called cleveite the element helium, the existence of which had previously been detected by spectrum analysis in the sun. Later, in conjunction with Rayleigh (q.v.) and M. W. Travers, he discovered krypton, neon, and xenon, gases which occur in minute quantities in the air.

After the discovery of radium by Pierre and Mme. Curie, Ramsay undertook a number of researches and estimated the molecular and atomic weights of radium emanation. In conjunction with F. Soddy he proved the transmutation of radium into helium. He died July 23, 1916. As a memorial a fund was organized to provide research fellowships and a laboratory of

engineering chemistry at University College, London.

Ramsay, Sir William Mitchell (1851-1939). British archaeologist. Born in Glasgow, March 15, 1851, and educated at Aberdeen, Oxford, and Göttingen, in 1880 he won a travelling studentship at Oxford, and subsequently spent many years in travel in Asia Minor.

Sir William Ramsay, British archaeologist

In 1882 he became fellow of Exeter, and in 1885 of Lincoln, Oxford, in the latter year being appointed professor of classical art in the university. Next year he was a professor of humanity at Aberdeen, a position he held till 1911. In 1928 he excavated at Antioch a triumphal arch of the emperor Augustus and reconstructed an inscription which was found in 280 fragments. His leading works, based on his archaeological researches, include his *Historical Geography of Asia Minor*, 1890; *The Church in the Roman Empire*, 1893; *St. Paul the Traveller*, 1895; *Pictures of the Apostolic Church*, 1910; and *The First Christian Century*, 1911. He died April 20, 1939.

Ramsbottom. Urban dist. of Lancashire, England. It stands on the Irwell, 4 m. N. of Bury, with a station in the London Midland region of British rlys. The industries of the district include calico printing, bleaching, and dyeing, cotton-spinning and weaving, paper making, and engineering. Market day, Sat. Pop. est. 15,000.

Ramsbottom arms

Ramsey. Market town and urban dist. of Hunts, England. It is 10 m. N.N.E. of Huntingdon, and is served by rly. There is an agricultural trade. The beautiful church of S. Thomas à Becket, partly Norman, has valuable objects of interest. There are slight remains of the rich Benedictine abbey founded here about 970. The town has associations with the Cromwell family, to whom the abbey lands passed at the Reformation. Ramsey Mere, once a lake in the fens, is now drained. Market day, Wed. Pop. 5,092.

Ramsey. Market town and seaport of the Isle of Man. It stands on Ramsey Bay, an open-

ing of the N.E. coast, at the mouth of the river Sulby. It is 16 m. N.E. of Douglas, with which it is connected by rly., electric tramway, and bus. An electric tramway runs to the top of Snaefell. A pleasure resort, the town has good sands, a swimming-pool, promenades, and a pier. In N. Ramsey is Mooragh Park with a marine lake, and on Frissel Hill is the Albert memorial tower. Ramsey existed in the 12th century, and has always been one of the most important places in the island. It has steamer services during the season. Market day, Mon. Pop. 4,240.

Ramsgate. Mun. bor., market town, seaport, and watering-place of Kent, England. It is on the E. coast, in the Isle of Thanet, 74 m. by rly. S.E. of London. Steamers go to and from London, and also to various Continental ports.

Ramsgate arms

Two stone piers enclose a fine harbour of refuge, accorded the title of "royal harbour" by George IV, which, dating from 1795, consists of an outer harbour of 42 acres, and an inner harbour. Except that of S. Lawrence, the chief churches are modern. There are the Victoria pavilion, a pier, dance halls, concert halls, two theatres, an esplanade between the E. and W. cliffs, and a marine drive. Ellington Park is one of several open spaces. The industries include fishing and shipbuilding, but Ramsgate is chiefly celebrated as being a popular holiday resort. Broadstairs lies to the N., and Pegwell Bay to the W.

During both Great Wars Ramsgate suffered under enemy attack. In the First it was bombarded

Ramsey arms

from sea and air, and in the Second it was considerably damaged by air raids, though the death roll was not heavy, principally because the town utilised a system of deep shelters, running some distance underground, tunnelled into the chalk at the back of the town, and connected with all the main streets. In 1940 about 80,000 men were landed here at the time of the evacuation of Dunkirk, and later it was used as a naval base. Pop. est. 35,000. See Frith, W. P.

Ramus, Petrus, or Pierre de la Ramée (1515-1572). French humanist, mathematician, and philosopher. He was a native of Picardy. Although his attacks on Aristotle made him unpopular, he was appointed in 1551 professor of eloquence and philosophy at the College of France. In supporting the claims of reason against dogma he anticipated the tendency of modern philosophy, and wrote the first French work on dialectics. He was assassinated during the massacre of S. Bartholomew.

Ramuz, Charles Ferdinand (1878-1947). Swiss writer. Born in the canton of Vaud, he lived there almost the whole of his life, except for years spent in Paris before the First Great War. Poet, essayist, and story-teller of Vaudois folk, he made a name with *Le Petit Village*, 1903, became famous in his own country, France, and Germany, but was little known in England. His most distinguished novels included *Passage du Poète*; *Beauté sur la Terre*; *La Guerre dans le Haut-Pays*. *Présence de la Mort* was translated into English as *The Triumph of Death*, 1946. Ramuz died May 24, 1947.

Ranavalona Manjaka III (1864-1917). Queen of Madagascar, 1883-96. After her accession at nineteen, in accordance with the custom of the island, she married her prime minister, Rainilaiarivony. She led a mean

Ramsgate, Kent. The beach and promenade, seen from the pier, looking east

and secluded life in her palace at Antananarivo, but efforts to assert her

Ranavalona,
Queen of Madagascar

She died May 23, 1917.

Rancagua. Town of Chile, capital of the prov. of O'Higgins. On the Southern rly., it is 165 m. S.E. of Valparaiso and 51 m. S. of Santiago, to which there is a good motor road. It is the centre of an agricultural district, and there are mines near. Pop. 38,423.

Rance. A river of Brittany, France, in the dept. of Côtes du Nord. It rises near the peak of Bel Air, and flows first E., and then N., to a long estuary at the mouth of which stands St. Malo. Small steamers ascend to Dinan; the picturesque lower course is canalised, and is connected by canal from Evran with the Vilaine at Rennes. Its length is 50 m.

Rancé, ARMAND JEAN LE BOUTILLIER DE (1626-1700). Founder of the Reformed Trappist Order. He was born in Paris, and became a protégé of Richelieu, who made him canon of Notre Dame and later prior of Boulogne. He was afterwards in high favour with Mazarin, and spent his time at court till in 1662 he retired to the monastery of La Trappe in Normandy, where he reformed the order and instituted a severe regime of discipline. He was the author of an Explanation of the Rule of St. Benedict and Moral Reflections on the Four Gospels. See Trappists; consult The Thundering Abbot, H. Brémond, 1930.

Ranch (Span. *ranch*o, mess-room). Cattle farm on a large scale which makes use of extensive natural pastures. Ranching as an industry began with the Spanish settlers in the New World, and gradually spread into the prairie region of the U.S.A., also into

Canada. The *estancia* of S. America and the station of Australia and New Zealand are virtually ranches. The improvement of stock contributed to the success of the industry, and raising pedigree bulls for S. America proved profitable to British breeders. Better methods of refrigeration also helped development. The S. American *gaucho* and N. American cowboy are typical employees of ranches whose life has become familiar through the "Western" film. See Argentina; Refrigeration.

Ranchi. District and town of Chota Nagpur, Bihar state, India. The district adjoins the Madhya union. Paddy fields cover most of the tilled area. The town is at 2,169 ft. alt. and is the hot weather capital of the province, h.q. of a C. of E. diocese, and a missionary centre. It has a technical college. Area 7,159 sq. m. Pop., dist., 1,675,413; town, 54,178.

Rancidity. Condition which obtains in oils and fats upon keeping, characterised by a rank unpleasant taste and smell. The change is due to the formation of free fatty acids in the presence of moisture, the process being accelerated by enzymes or organic matter. The rancidity of butter is greatly assisted by the casein left in the fat. The change which takes place in olive oil results in the formation of oleic acid. If fats and oils are protected from light, air, and moisture, they retain indefinitely their state of neutrality.

goldfield, which was proclaimed in 1886. Gold had been found in the locality in 1854; 30 years later a small battery was erected, and quartz mining begun by the brothers Struben. The gold ores are low grade, in more or less horizontal reefs. Deep mining is facilitated by the unusually small rise in temp. experienced as depths increase, only 1° F. for every 212 ft. descended.

In the 1920s the Transvaal was yielding half the gold mined in the world, and by 1940 it was still producing over a third. An output of a million oz. in a month was first achieved in 1938, since when annual output has varied between 12 and 14.4 million oz. Before the Second Great War the annual value was approaching £60,000,000. The Rand refinery was started in 1920 as a private company owned by mining concerns. See Chinese Labour; Gold; Johannesburg; Mining; South Africa; Transvaal.

Randers. Town of Denmark, on the N.E. coast of Jutland. It stands at the mouth of the river Guden at the head of Randers Fiord, 22 m. N.N.W. of Aarhus. Its most prominent feature is a fine 14th century church. It exports corn, butter, eggs, wool, and fish. Pop. 30,254.

Randolph. Noted Scottish family, several of whom were earls of Moray. Thomas, the 1st earl, was a nephew of Robert Bruce. Captured by the English at Methven, 1306, he turned against

Rand, Transvaal. Map showing the goldfields (shaded areas) and the reefs (heavy black lines)

Rand or WITWATERSRAND. Gold mining district in the Transvaal, S. Africa. The ridge extends roughly E. and W. for some 40 m., and its reefs or mineralised beds of conglomerate (banket) consist of quartz pebbles cemented by gold-impregnated silica, iron oxides, etc., and contain, it is estimated, the largest reserve of auriferous ores in the world. Johannesburg is the centre of the

Bruce, but was reconciled and created earl of Moray, 1308. In 1329 he became regent for David II, and he died at Musselburgh, July 20, 1332. His eldest son, Thomas, was slain at Dupplin Moor three weeks later, and his second son, John, at Neville's Cross, 1346. The earldom passed to his sister Agnes Dunbar (c. 1312-69), famed in Scottish history as Black Agnes.

Randolph, EDMUND JENNINGS (1753-1813). American statesman. Born at Williamsburg, Va., Aug.

Edmund Randolph, American statesman

10, 1753, he was a member of congress, 1779-82, and governor of his state, 1786-88. At the Constitutional Convention of 1787 he proposed the Virginia plan, a scheme to establish two houses on a population basis, and expressed himself strongly against a single executive. Although he refused to sign the final draft, he recommended Virginia to accept it rather than endanger the Union, of which he was the first attorney-general, 1789-94. He then became secretary of state, but resigned in 1795 on being unjustly suspected of attempting to obtain money from France as the price of stirring up ill-feeling against Great Britain. He died Sept. 13, 1813.

Randolph, JOHN (1773-1833). American politician, generally known as Randolph of Roanoke. Born at Cawsons, Va., June 2, 1773, he was a descendant of Pocahontas (*q.v.*). He was four times a Democratic member of congress between 1799 and 1829, and senator, 1825-27, when he fought a duel with Henry Clay, whom he had insulted by calling him a blackleg. Randolph gave his own slaves freedom by the terms of his will, and left provision for their support. He died at Philadelphia, June 24, 1833. *Consult* Life, W. C. Bruce, 1923.

Randolph, THOMAS (1605-35). English poet and dramatist. Born at Newnham-cum-Badley, Northants, and educated at Westminster, Oxford, and Cambridge, he was a protégé of Jonson and a minor wit. His plays, which contain many allusions to contemporary life, include *The Muses' Looking Glass*, a defence of the drama; *Amyntas*, a pastoral; and two comedies, *The Jealous Lovers* and *Hey for Honesty*. Randolph was buried on March 16, 1635. His best work was published posthumously; W. C. Hazlitt edited it in 1875.

Ranelagh. Former London place of amusement. At the E. of Chelsea Hospital, its gardens form part of the grounds of that institution. It was named after Richard Jones, 3rd viscount and 1st earl of Ranelagh, who built a house and laid out gardens here, 1690-91; and from 1742 to

1803 rivalled Vauxhall (*q.v.*). A notable feature was the Rotunda, a huge structure resembling the British Museum reading-room. Contemporary writers such as Horace Walpole bear witness to the popularity of the masquerades, concerts, and other entertainments of which Ranelagh was the centre.

Ranelagh was the name given to a London club instituted in 1894, at Barn Elms Park, Barnes, to provide facilities for polo, croquet, golf, and lawn tennis. The Ranelagh in Paris is a grass plot

Ranelagh. The interior of the Rotunda, at this former London place of amusement

and avenue near the Porte de la Muette, which was once the site of a club founded in 1774, and noted for its fêtes.

Range-finder. An instrument used to ascertain the distance of a target from the firing point. Various types have been evolved to meet the different conditions experienced in warfare. The majority depend on the principle of measuring the angles of the triangle which is formed by making the target the apex and the instrument the base; and in order to simplify the measurements to be taken it is usual to arrange that one of the base angles is a right angle, leaving only one unknown angle to measure. The instrument is thus actually a goniometer (angle measurer).

A simple instrument of this type was the mekometer (length measurer), used by British infantry, consisting of two reflectors joined together by a cord 25 or 50 yards long. One observer was at each instrument, these being so arranged that the one showed when the

base made a right angle with the imaginary line to the target, and the other could then be sighted on the same object by adjusting a knob which carried a pointer moving over a dial graduated direct in yards instead of angles.

The vastly increased power of modern artillery, making it possible for guns to fire accurately to ranges of 20,000 yards, has naturally demanded equivalent progress in the science of range-finding, and the instruments made by Barr and Stroud, and supplied to the British services, are outstanding examples of modern practice. They are based either on the coincidence or the stereoscopic principle. Essentially these also are dependent on measuring the angles which two beams of light from the target make with the opposite ends of a known base line, and the latter is formed by a rigid metal tube having pentagonal reflecting prisms fixed at each end. These prisms divert the beams of light along the axis of the tube, and through objective lenses also fixed near each end. At the centre of the tube of a coincidence range-finder other prisms divert the beams into a single eyepiece, and are so arranged that the beam of light from the right end forms the upper, and that from the left the lower, half of the field. It is thus obvious that the angles of the prisms must be varied to enable a continuous complete image to be obtained of targets at varying distances from the base.

In practice, especially at long ranges, if the base is made of any convenient length, the angular variations required of the prisms are so small that sufficiently accurate mechanical movement could not be arranged, and, further, the scale would be too fine to be read. These difficulties are obviated by interposing between one of the object glasses and the eyepiece a deflecting prism of small angularity, and definitely fixing the pentagonal prisms in the ends of the tube. By moving the deflecting prism along the optical axis the beam of light is diverted as if the angularity of the pentagonal prisms were altered,

Range-finder. Diagram illustrating principles on which the Barr and Stroud instruments are constructed

but as the motion of the deflecting prism is considerable, an easily read scale can be provided, and the accuracy required of the mechanical adjustment can be attained.

Suitable lenses are also provided for use when required, which

distort a small object, such as a single light, into a vertical line, thus rendering it easy to see when the two half images coincide, and an optical system is also provided for checking the accuracy of the readings. In stereoscopic range-finders the right and left beams of light are diverted into separate eyepieces and a stereoscopic view of the target is obtained.

The deflecting prism device is then used to vary the apparent depth of the target relative to a mark in a fixed graticule, also seen stereoscopically, or in some cases to a secondary image of the target. The range is obtained when the target image appears to be at the same distance as the mark or the secondary image. The greater the length of the base, the more accurate are the determinations, especially at long ranges, and for naval and fortress use the instruments have a length between the pentagonal prisms of 9 to 100 feet, while portable range-finders for the infantry have a base of about 28 ins. For A.A. work an instrument was devised on the same principle, giving simultaneous readings of range and height. See Guns; Ordnance.

Ranger. In England, the keeper of a royal forest or park. The office is a royal appointment by letters patent, and it was formerly the holder's duty to range or walk through a forest watching deer, preventing trespassers, and recovering beasts that had strayed. The office is now a sinecure awarded to some prominent person as a mark of royal approbation. The term has several other applications. U.S. army commando units are called rangers. In the girl guide (*q.v.*) movement, ranger is a grade for girls between 16 and 21; sea rangers are a branch equivalent to the sea scouts of the boy scout movement. Princess Elizabeth became chief ranger of the girl guides in 1946. Sporting dogs of the game-seeking type are called rangers.

Rangers. Popular name for the Glasgow Rangers football club, founded in 1873. The ground and registered offices are at Ibrox stadium. Between 1899 and 1939 the club won the Scottish league

Rangoon, Burma. The Shwe Dagon pagoda; left, the entrance, and, right, the main building

championship 23 times (also in 1947) and from 1897 to 1939 the Scottish cup on nine occasions, and were joint holders in 1948.

Rangoon. Capital of Burma (*q.v.*). Built on an ancient site where a city was founded in 746, Rangoon was so called by Alompra when he made it his capital in 1752. The meaning of the name is "end of conflict." It was formerly called Dagon. It lies on the Rangoon river, here met by the Pegu and Pazundaung rivers, about 21 m. from its mouth. There is rly. connexion with Moulmein, Mandalay, Prome, and Bassein, and Rangoon ranks high as a port. It is the main export centre of the great Burmese rice-fields, other exports including teak, raw cotton, petroleum, and hides. Imports are miscellaneous, including cotton, machinery, silk, and sugar.

To the W. of the picturesque Royal Lake lies the famous Shwe Dagon Pagoda, one of the greatest pilgrimage shrines of Buddhism, rising to a height of 370 ft. and magnificently gilded. Traditionally founded in 585 B.C., it has been little altered since the 16th century. The Sule Pagoda in the heart of the town is also notable. Modern buildings include Government House, Jubilee Hall, Anglican and R.C. cathedrals, and other features are the native bazaars, the lakes to the N. of the city, and the remains of the once important city of Syriam. In 1920 a university with two colleges was established. Rangoon college and collegiate school was founded in 1874.

In 1790 an East India Company factory was established in the small stockaded town. It was held by the British in 1824-27, and was rebuilt on a new site by Konbaung Min in 1841. The development of Rangoon since its capture by the

British in 1852 has been rapid; its pop. almost doubled during 1872-91. Frequently bombed by Japanese aircraft, Rangoon was evacuated by British forces on March 7, 1942. It was liberated on May 3, 1945, by Anglo-Indian forces landed from the sea, the Japanese offering little resistance. The port was reopened to shipping about six weeks later, and on Sept. 13, envoys signed here an instrument of surrender of all Japanese forces in Burma. Pop. 400,415. See Burma Campaign.

Rangpur. Dist. and town of E. Bengal, Pakistan, in the Rajshahi division. The dist. is adjacent to Assam and Cooch Behar, and is drained by the Tista tributary of the Brahmaputra. Tobacco is cultivated for trade and export. Jute is an important crop, and 60 p.c. of the area cultivated comprises paddy fields. The annual rainfall is 84 ins. Area, 3,606 sq. m. Pop. 2,877,847. The town, almost in the centre of the dist., has 34,039 pop.

Ranibennur. Town of Bombay state, India, in Dharwar district. It is situated in the S.E. of the district near the borders of Mysore and Madras, and is on the rly. from Bombay across Mysore. Silks and cottons are manufactured. Pop. 13,500.

Ranjit Singh, MAHARAJA (1780-1839). Indian ruler. Born Nov. 2, 1780, in 1797 he assumed the chieftainship of the Sikhs, capturing Lahore in 1799 and Amritsar in 1802. Ambitious to found a Sikh empire, he aroused the suspicions of the British government, which in 1809 bound him by treaty to confine his authority to the N. of the Sutlej. Reorganizing his army with European officers, during the next 15 years Ranjit Singh extended his realm to include almost all the Punjab. He died June 27, 1839.

Ranjitsinhji, KUMAR SHRI,
MAHARAJA OF NAWANAGAR (1872-1933). Indian prince and cricketer.

K. S. Ranjitsinhji,
Indian prince

Born at Sardar, Sept. 10, 1872, he was educated in India and at Trinity College, Cambridge. One of the greatest and most attractive batsmen who ever lived, renowned for a glance to leg, in 1895 he became a member of the Sussex cricket team; he had already played for Cambridge, and between 1896 and 1902 represented England against Australia. Heading the averages in 1900, he scored 3,065 runs at an average of 87.57; he also finished top in 1896 and 1904, and in 1899 scored 3,159. In 1906 he succeeded his cousin as maharaja of Nawanagar. "Ranji" provided troops for the Empire in the First Great War, himself serving at the front, 1914-15. Twice a representative of Indian princes at Geneva, he helped to found the chamber of princes. Chancellor in 1932, he spoke in the chamber, on the dangers of federation, just before his death on April 2, 1933. *Consult Life, R. Wild, 1934.*

Rank. Grade or dignity of a number of persons forming a certain class in organized society. Ranks may be loosely differentiated without particular reference to function, as in commonly accepted social distinctions; or formed with strict definition of status and authority, as in ecclesiastical and military organizations.

In the British naval, military, and air services there are two types of rank, commissioned and non-commissioned, and each rank in one service has its equivalents in the other two. The lowest naval rank, ordinary seaman, is equivalent to private, guardsman, trooper, rifleman, fusilier, gunner, signaller, sapper, or craftsman in the army, and aircraftman in the R.A.F. Between private and corporal in the army, between aircraftman and corporal in the R.A.F., is a classification of lance-corporal and leading aircraftman respectively. The lowest non-commissioned naval rank, leading seaman, is equivalent to corporal; while the highest chief petty officer is equivalent to sergeant-major in the army and flight sergeant in the R.A.F. Between corporal and sergeant in the army comes lance-sergeant. In all services a warrant

NAVY	ARMY	AIR FORCE
 Admiral of the Fleet	 Field Marshal	 Marshal of the Royal Air Force
 Admiral	 General	 Air Chief Marshal
 Vice-Admiral	 Lieutenant General	 Air Marshal
 Rear-Admiral	 Major General	 Air Vice-Marshal
 Commodore	 Brigadier	 Air Commodore

RANK. BADGES OF EQUIVALENT RANKS—

officer ranks between commissioned officer and n.c.o.

Sub-lieutenant, the lowest commissioned rank in the navy, is equivalent to second lieutenant in the army and pilot officer in the R.A.F.; while admiral of the fleet, the highest, is matched by field-marshal and marshal of the R.A.F. When an army officer is confirmed in his rank he holds what is called substantive rank. Brevet rank is a temporary higher stage which does not entitle the holder to the higher pay. Temporary rank is usually granted to an officer holding an appointment usually taken by one of higher rank than himself. Acting ranks are a variant of temporary, usually granted to meet situations where an establishment of short duration must be completed quickly.

Honorary rank, frequently granted in territorial and auxiliary forces to civilians, carries the privileges but not the pay of rank.

Officers commissioned in all services in both Great Wars held temporary rank, while all promotions

in commissioned or non-commissioned ranks, even of regular officers, were to temporary rank from the substantive rank held at the outbreak of hostilities. After the war many regular officers and n.c.o.s holding high temporary rank reverted a long way.

In the women's branches of the army and R.A.F., non-commissioned ranks are the same as those for men; and in the W.R.A.C. women's commissioned ranks were in 1950 given the same titles as men's. The W.R.N.S., which is a civilian organization, has its own system of ranks. *See Caste; Nobility; Peerage; Precedence;* also separate entries under the various ranks, e.g. Admiral; Corporal; Flight Sergeant; General; Warrant Officer.

Rank. Military term to describe a formation of men drawn up in a single line and facing front. Until 1936, men fell in on parade in two ranks and then moved into four; today the formation is three ranks, front, centre, and rear, except when the squad has to be sized

according to height, when they make one or two ranks preparatory to being sized. Each section, front to rear, of a three-rank formation is called a file (*q.v.*), and when the ranks right or left turn to march off the front is in file; the second file covering the first, the third the second, and so on. When marching past in review order, the formation is three ranks in depth, keeping its dressing by the extreme right or left file. The term, in the ranks, is a popular expression to describe the private soldier. The term, rank and file, is used for privates and non-commissioned officers; other ranks refers to privates only. The term applies to any collective body, *e.g.* "In the ranks of death you'll find him."

Rank, JOSEPH ARTHUR (b. 1888). British financier.

J. Arthur Rank,
British financier

Born at Hull, Dec. 23, 1888, he was educated at Leys School, and entered his father's flour-milling firm, retaining a large financial interest in milling. He founded a society exhibiting religious films and developed it to deal with commercial pictures. In 1935 he acquired the General Distributors' company, which became the chief distributing organization for his many film companies, *e.g.* Gaumont-British, Ealing Studios, Odeon Theatres, Gainsborough, Two Cities, and Eagle-Lion. Rank carried out his intention of placing British films on the world market while maintaining a sound moral tone.

Ranke, LEOPOLD VON (1795–1886). German historian. Born Dec. 21, 1795, at Wiehe, Thuringia, he was educated in Saxony, and at the university of Leipzig. Teacher at Frankfort-on-Oder, he wrote there in 1824 his first book, and on the strength of it was made professor extraordinary at Berlin. After three years in Berlin, Ranke went abroad to continue his studies. He was first in Vienna, and then

for three years in Venice, Rome, and elsewhere in Italy, working hard on historical documents. He returned fully equipped for his life-work; in 1837 he became full professor at Berlin, and there he lectured almost until his death. He was made historiographer of Prussia, and died May 23, 1886.

Leopold von Ranke,
German historian

Ranke's works, as collected in 1881, fill 51 vols. The greatest are probably his History of the Popes, and his History of Germany during the Reformation. His History of England deals chiefly with the 17th century, and is especially valuable for its account of the relations between England and other European powers; like the History of the Popes, it has been translated into English. His History of France deals with much the same period. When blind and over 80, he began his History of the World; he carried the story down to the crusades.

Ranke was beyond comparison the greatest historian of his age. He taught his pupils to find the material of their work in nothing less than the original authorities themselves, to examine them critically, to consider the circumstances in which they were written, and the characters of their writers.

Rankin, JEANETTE (b. 1880). First woman elected to the U.S. congress. Born near Missoula, Mont., June 11, 1880, she studied at the school of philanthropy, N.Y., and was a social worker in Seattle. Active in the female suffrage movement before the First Great War, she became the first woman to sit in congress, 1917–19, representing Montana as a Republican. She again sat in congress during 1941–43.

Rannoch. District in the N.W. of Perthshire, Scotland, giving its name to a moor, a loch, and a rly. station. The moor, marshy and desolate, is about 20 m. sq., extending into Argyllshire, and at an average alt. of 1,000 ft.; it figures in Stevenson's Kidnapped. The loch is 9 m. E. to W. and 1 m. N. to S.; it contains two islands, receives the Eicht, and is drained by the Tummel into the Tay. Hydro-electric works are important here. Rannoch station, on the line to Fort William, is 6 m. W. of the loch, at the E. end of which is

Kinloch Rannoch, a stone village and the point from which to climb Schiehallion.

Rannoch, Scotland. The loch from Creaganour

Ranpur. Part of Orissa, India. It was the most southerly of the Orissa feudatory states, on the borders of the Cuttack division. Its area is 204 sq. m. Pop. 51,366.

Ransom (Lat. *redemptio*). The money paid for the release of a prisoner. In medieval warfare it was usual for knights and others of high rank who were taken prisoners in battle to be ransomed, the money being in the nature of a prize for the victor. England paid a large sum for Richard I and France for John II. The practice prevailed until about 1800, when the method of exchanging officers according to rank was substituted. Ransoms were paid to release captured ships and save towns from being sacked.

Ranters. Puritanical sect which flourished during the Commonwealth, 1653-58. Denying the Scripture and all outward manifestation of religion, they taught the presence of God in everything in nature, and were virtually pantheists. After the frenzy of the Commonwealth, the sect died out, but the name was revived about 1850, and given to the Primitive Methodists on account of the style of their denunciatory preaching.

Ranula (Lat., little frog). Cystic swelling on the floor of the mouth due to obstruction and distension of the duct of one of the sublingual or salivary glands. The treatment consists in removing a part of the wall of the cyst, which then disappears. In some cases it is necessary to remove the whole cyst. The swelling is so named from its fancied resemblance to a frog.

Ranunculaceae OR BUTTERCUP FAMILY. Large family of (mostly) herbs, natives of temperate and cold regions. Both leaves and flowers vary greatly in their forms in the numerous genera. The fruit is either a single-seeded nutlet (achene) or a many-seeded pod

(follicle), splitting along one side. The juices of the plants are usually acrid and often highly poisonous. Such well-known genera are included as Clematis, Anemone, Helleborus, Aquilegia, Delphinium, and Aconitum, and the typical genus Ranunculus. See Anemone; Buttercup; Clematis; Hellebore.

Ranunculus. Genus of annual and (mostly) perennial plants, of the above family Ranunculaceae. The most popular wild member, the buttercup, is one of 15 natives of the U.K. Others have been introduced into gardens from abroad at various dates since 1596. The old garden ranunculus (*R. asiaticus*) is tuber-rooted, and should be planted in Feb. in good loam, and well watered. Varieties are innumerable, and flowers of all shades and colours. The roots should be taken up annually in autumn, and stored in sand, in a cool place.

Ranyard Mission. Home mission and nursing society founded in 1857 by Mrs. Ellen Henrietta Ranyard (1809-1879) in the parish of S. Giles, London. It began as a Bible-selling mission in the district known as Seven Dials. Later it opened a lodging house for girls, a medical mission, and a seaside rest home, and developed a home nursing service in S. London. As the Ranyard Nurses, it became part of the L.C.C. district nursing organisation, with its h.q. at 11, Tavistock Street, London, W.C.1.

Rap. Counterfeit Irish copper coin current in the time of George I. It passed as a halfpenny, though intrinsically worth only a quarter of its nominal value. Derived from rapparee, used of Irish armed freebooters, the word survives in the expression "not worth a rap," i.e. valueless.

Rapallo. Small seaport and favourite health resort of the Italian Riviera, in the prov. of Genoa. Sheltered by mountains at the head of the Gulf of Rapallo, 16 m. by rly. E.S.E. of Genoa, it has a castle, now used as a prison, interesting churches (that of S. Martin being damaged in the Second Great War), a zoological garden, and a Roman bridge. In the vicinity is a popular pilgrimage church. Lace and olive oil are the principal products. Tunny fishing is an industry. Pop. 14,000.

Rapallo, TREATIES OF. The first was signed by Italy and Yugoslavia, Nov. 12, 1920. It settled various territorial disputes arising out of the First Great War. By the pact of Rome, April 8, 1918, Italy recognized the unity and independence of the Yugoslav nation,

and the freedom of the Adriatic, but when Yugoslavia occupied Carinthia, Italy demanded the annexation of Fiume, and other places on the eastern Adriatic. (See Annunzio, Gabriele d'; Fiume). By this treaty the frontier between the two nations was fixed, and Italy renounced Dalmatia, but Zara, together with its commune and several adjacent ones, was placed under Italian sovereignty. Both powers recognized the independence of Fiume. Former Austrian or Hungarian subjects within the territories placed under Yugoslavia were given the option of claiming Italian nationality within one year. By this treaty 400,000 Slavs passed under Italian rule. But it finally settled the Adriatic question, giving Yugoslavia possessions on the coast. See Italy; Yugoslavia.

A second treaty of Rapallo was signed by Germany and Russia on April 16, 1922, largely because of efforts by the German foreign minister Rathenau. The two countries cancelled their mutual claims to war indemnities and offered to each other the position of most favoured nation in economic affairs. On Nov. 5 the provisions of the treaty were applied to the new Russian republics.

Rape (Lat. *rapa* or *rapum*, turnip). Cruciferous forage crop which may either take the place of ordinary roots in a rotation or be grown as a catch crop, and is an excellent sheep feed. There are two kinds, the smooth-leaved summer rape (*Brassica campestris*) or dwarf, and the rough-leaved winter rape (*B. napus*) or giant. Swede and turnip are derived from these respectively, but have developed enormously thickened roots. The dwarf variety is suited to calcareous soils, and the giant to heavier kinds, especially those of the fen districts. The method of cultivation and manuring is the same as for turnip, and careful preparation of the seed-bed is necessary. The seed is either drilled (5 lb. per acre) or broadcast (up to 10 lb. per acre). Giant rape is commonly sown in May or June, and is ready to be fed off in the autumn. As a catch crop for providing spring fodder it is put in during July or August. See Brassica; Turnip.

Rape (Lat. *rapere*, to seize). In English law, the carnal knowledge of a woman without her consent. Rape is not necessarily forcible. It may be committed by fraud, e.g. personating a woman's husband. It is punishable by imprisonment for life or a shorter period.

By the Attempted Rape Act of 1948, the attempt has been made punishable by seven years' imprisonment.

Rape. Division of the county of Sussex. It is the equivalent of the hundred in other counties. There are six rapes, Hastings, Pevensey, Lewes, Bramber, Arundel, and Chichester. The rapes are mentioned in Domesday Book. In early times each had its own lord and took its name from his castle. *See* Sussex.

Rape Cake. Artificial feeding-stuff made from rape seed after extraction of the oil. If pure, it is a valuable food for milch cows. Rape cake, ground into rape dust or meal, is also used as a manure, and gives good results with wheat, barley, roots, including potatoes, and hops.

Rape of Lucrece, THE. Poem by Shakespeare in seven-line stanzas, published 1594, and founded on the story, told in Ovid's *Fasti*, of the rape of Lucretia, the wife of Collatinus, by Sextus Tarquinius. She sends for her husband and father, and, calling upon them to revenge her, then kills herself. *See* Lucretia.

Rape of the Lock, THE. Mock-heroic poem by Alexander Pope. First published, anonymously and incompletely, in 1712, it was based on an incident which resulted in the estrangement of two families. Lord Petre had, in the summer of 1711, cut a lock of Arabella Fermor's hair, and it was suggested to Pope by a friend that he should try to effect a reconciliation. The result was *The Rape of the Lock*, of which James Russell Lowell has said that, taken in all, it is the most perfect poem in the language. It gives a wonderful impression of the social life of the time.

Raphael. In the O.T. Apocrypha, one of the seven angels which present the prayers of the saints and go in and out before the glory of the Holy One (Tobit xii. 15). He is represented as being sent to cure Tobit of blindness and to bind the evil spirit Asmodeus (*q.v.*). *See* Angel.

Raphael (1483-1520). Italian painter. Born at Urbino, April 6, 1483, his father was Giovanni Santi, a poet and painter, whose name latinised into Sanctus was in the son's italianised back into Sanzio. His early training was under Timoteo Viti, but when seventeen he went to Perugia, to work in the studio of Perugino, and from the elder artist derived a lasting impression. Later on, he was in Florence, where he made a particular study of the work in sculpture of Donatello and Michel-

angelo, and of the paintings of Leonardo. He also at that time became the intimate friend of the Dominican, Fra Bartolommeo. To this period of his career can be attributed his long series of paintings of the Madonna and Child, and his greater altarpieces. In 1508 he was in Rome, entrusted by Julius II with the decoration of certain rooms in the Vatican. It was then that he painted his great group of

*From a self-portrait
in the Uffizi
Gallery*

Raphaello

the Greek Philosophers, generally known as the School of Athens.

In 1512, Leo X, who had succeeded Julius II, commissioned certain other frescoes, and the work was finished in 1514. One of the artist's most important portrait groups represented this pope with two cardinals. Raphael's designs for the tapestries of the Sistine Chapel were prepared in 1515, and seven of them constitute one of the great treasures of England, and can be inspected at the Victoria and Albert Museum.

Raphael's architectural work commenced in 1514, when he was appointed by Leo X to succeed Bramante as architect of S. Peter's. The position entailed great labour, and he added to it the preparation of a survey of Ancient Rome, cartoons for other frescoes in the Vatican, portraits of many notable persons, and a great picture of the Transfiguration, which he intended should be one of his noblest works. This picture he was never able to complete, only the upper portion of it was from his hand, and he died on Good Friday, April 6, 1520, of fever, which he is believed to have caught when inspecting an ancient monument in the neighbourhood of Rome.

His works are very numerous, and he also left behind him a vast store of sketches. He can best be studied in the Vatican, and in the galleries of Florence, Rome, London, Paris, Dresden, and Madrid. His most popular pictures are the wonderful Madonna de San Sisto, in Dresden; the Madonna della Sedia and the Madonna del Gran Duca in Florence; the St. George and the Dragon in Petrograd; the portraits in the Pitti Gallery in Florence; and the Ansidei Madonna in London. The last named was painted for the Ansidei family of Perugia, about 1506, and bought in 1885 for the National Gallery, which contains, among other examples, a delicate instance of the master's early manner in the small *Vision of a Knight*. His earliest important work under the Perugino influence is the Crucifixion in the Mond collection in London. Raphael's Madonnas, notably the San Sisto at Dresden, are the greatest works of their kind the world has ever seen. No other artist ever painted such Divine tenderness in a woman's face or produced pictures which so fully "create a religious emotion."

Raphael is believed to have painted about two dozen portraits, but some are doubtful attributions, and some are no longer extant. His self-portrait in the Uffizi was probably painted at Urbino in 1506, and his beautiful portrait of an unknown lady in that gallery is of similar date. The impressive portrait of Pope Julius II, in the Pitti Gallery, with replica in the Uffizi, dates from 1511-12, and that of Baldassare Castiglione, in the Louvre, is a well-known portrait which later excited the admiration of Rembrandt and Rubens. His portraits are generally reckoned of secondary importance in his work, but in the best of these Raphael showed in a small compass the same mastery of drawing and power of conveying character as in his greater compositions. *See* Italy; Art; also *illus.*; Angel; Art; Galatea; Gregory VII; Halo; Horace; Jesus; Julius II; Madonna; Painting; etc.

Raphia Palm (*Raphia*). Small genus of trees of the family Palmae. They are natives of tropical Africa, Madagascar, and S. America. They have short trunks, but the leaves are frequently of enormous length, and the fact that they are erect causes them to appear much larger in proportion to palms with arching leaves. Those of *R. ruffia*, from

Raphia Palm. *R. taedigera*, the short-timbered variety found in the Amazon region

the Mascarene Islands, are 50 or 60 ft. long, and of feather-form. The flower spikes also are large—six ft. long. Its fruits are as large as eggs of the domestic fowl, covered with smooth, hard, overlapping scales, and containing a single seed. The fruit-clusters weigh 200–300 lb. *R. taedigera*, native of the Amazon region, has leaves of similar length and seven or eight feet wide, whose leaf-stalks, 12 to 15 ft. long, serve many of the uses of bamboos, and cut into thin strips are plaited into baskets. *R. vinifera* (Wine palm), native of W. Africa and the Amazon region, from the similar use made of its leaf-stalks is known as the bamboo-palm. See Africa.

Raphoe. Market town of co. Donegal, Eire. It is 15 m. S.W. of Londonderry. The chief building is the church, formerly a cathedral, dating in part from the 11th century, and there are remains of the bishop's palace. Woollens are manufactured, and in the neighbourhood are raths, mounds, and other antiquities. Raphoe was made the seat of a bishop in the 8th century. The Church of Ireland diocese of Raphoe extends into Donegal, Antrim, Londonderry, and Tyrone; the R.C. diocese covers 26 parishes in co. Donegal. Market day, Sat. Pop. 2,600.

Rapids. Part of a stream's course where the current flows much more quickly than the average, making navigation almost impossible. Rapids are frequently caused by differences in the hard-

ness of the rocks over which a stream flows. Soft layers are cut more rapidly than hard, so that rapids occur where the stream flows from hard to soft layers.

Rapier (Fr. *rapire*). Light, slender sword of highly tempered steel used solely for thrusting. It is about three feet in length, and was a favourite weapon with duellists in the 16th and 17th centuries. The rapier was simplified and developed to its best in Italy, France, and Spain, and in the hands of a well-trained fencer became a most deadly weapon of offence. Its very lightness, backed by strong and supple wrist-play, proved effective against inferior opponents, while the guard remained impenetrable to the most determined attack. The successor to the rapier as a duelling weapon was the shorter small-sword of the 18th century. See Fencing.

Rapin de Thoyras, PAUL DE (1661–1725). French historian. Born at Castres, Tarn, March 25, 1661, he was driven from France by the revocation of the edict of Nantes. He followed William III to England; distinguished himself as a soldier; and was afterwards tutor to the earl of Portland's son. In 1707 he settled at Wesel, and wrote his *Histoire d'Angleterre*, 1724, Eng. trans. 1757–63. He died May 16, 1725.

Rapp, JOHN GEORGE (1770–1847). Founder of the Harmonist sect. Born at Württemberg, Germany, from youthful days he was afflicted with visions in which he thought himself called to purify religion. With a few followers he went to America in 1803, and founded his Harmonist sect at Pittsburg. He taught community of goods and wives, and gathered considerable wealth. After removing the concern to Indiana, he sold it in 1823 to Robert Owen, and founded the colony of Economy near Pittsburg, where he died. See Harmonists.

Rapp, JEAN, COMTE DE (1771–1821). French soldier. Born at Colmar, Alsace, April 26, 1771, he distinguished himself in Egypt, in Italy and at Austerlitz, and in recognition of the part he played as Aspern in 1809 was made a count. He also shared in the Russian campaign, and subsequently defended Danzig for nearly a year against the Russians. In 1814 he made his peace with the Bourbons, but he deserted to Napoleon in the Hundred Days' Campaign and was proscribed. In 1818 his status was restored by Louis XVIII. Died Nov. 8, 1821.

Rappahannock. River of Virginia, U.S.A. Rising in the Blue Ridge, it follows a S.E. course to Chesapeake Bay, which it enters by a wide estuary. It receives the Rapidan, and is navigable to Fredericksburg, about 90 m. from the sea. Its length is 250 m.

Rappard, WILLIAM E. (b. 1883). Swiss political economist. He was born in New York, April 22, 1883, and educated at the universities of Geneva, Berlin, Munich, Harvard, Paris, and Vienna. After being assistant professor at Harvard in 1911, he was appointed professor of political economy at Geneva in 1913. During the First Great War he was engaged in diplomatic missions in the U.S.A., France, and Great Britain, and from 1920 to 1925 acted as director of the mandates section of the League of Nations. Founding the Geneva graduate school of international studies, he directed it from 1928. In 1938 he became chairman of the International Red Cross (*q.v.*). He wrote many books on international affairs, notably *The Geneva Experiment*, 1931; *The Crisis of Democracy*, 1938.

Rapparee. Term derived from an Irish word for a pike. It was used for those irregular Irish troops who assisted James II in his struggle against William III. Afterwards it became a term for a robber.

Rare Earths. Oxides of certain rare metallic elements occurring in nature only in this form. They are found in mineral deposits (usually silicates) occurring in only a few scattered regions of the world, mainly in the Urals, S. India, Scandinavia, Brazil, and the U.S.A. All rare earth metals are in Group III of the periodic table. The main body, 15 in number, forms a series with atomic numbers running from 57 to 71 known collectively as lanthanides. To these are usually added scandium (At. No. 21) and yttrium (At. No. 39). The rare earth elements are as follows:

CERITE GROUP	GADOLINITE GROUP
Atomic No.	Atomic No.
57 Lanthanum	64 Gadolinium
58 Cerium	65 Terbium
59 Praseodymium	66 Dysprosium
60 Neodymium	67 Holmium
61 Itrium (?)	68 Erbium
62 Samarium	69 Thulium
63 Europium	70 Ytterbium
	71 Lutecium
	21 Scandium
	39 Yttrium

The isolation of illinium had not been confirmed in 1948.

Rare earths generally contain several rare earth metals belong-

ing to the same group. The metals are closely similar in chemical and physical properties. The rare earth elements are exceedingly difficult to separate. Fractional crystallisations of salts and double salts are the methods most commonly used and a large number of such crystallisations may be required.

The arrangement of the orbiting electrons in the 15 rare earth elements forming the main body is such that the atoms of all present exactly the same external formation. The electron orbits round the nucleus of an atom form groups corresponding to different energy levels. Starting with that nearest the nucleus, these groups are known as 1, 2, 3, etc. The orbits are elliptical and in each group, except No. 1, there are sub-groups known as $2_1, 2_2; 3_1, 3_2, 3_3$, etc. The large figures and the subscripts denote the ratios of the major and minor axes. Thus in 2_1 , the ratio is 2 : 1; the orbit is an ellipse with one diameter twice as great as the other. But in 2_2 the diameters are equal and the orbit is a circle. Similarly $4_3, 4_2$, and 4_1 are ellipses of greater and greater eccentricity, but 4_1 is a circle.

The full complement of electrons in a group is $2n^2$, where n is the number of the group. Thus in group 1 it is $2 \times 1 \times 1 = 2$; in group 2, $2 \times 2 \times 2 = 8$; in group 3, $2 \times 3 \times 3 = 18$; in group 4, $2 \times 4 \times 4 = 32$. The electron pattern of the lanthanide elements is $2/8/18/32/9/2$.

The most familiar of the rare earth elements is cerium, minute fragments of which become very hot when exposed to air. An alloy of cerium and iron is used for making the "flints" of cigarette lighters. Cerium also plays a useful part in incandescent gas mantles. Thoria (thorium oxide) was formerly classed as a rare earth. It occurs in conjunction with cerium in the earth known as monazite, found in Southern India. It used to be thought that the brilliance of incandescent gas mantles was due to the thoria with which they are impregnated; but when pure thoria was eventually isolated it was found that mantles treated with it produced only a dim light. The addition of a small quantity of cerium causes the mantle to emit a brilliant light.

The list of rare earth elements may undergo a revision. Some have suggested that a new family of rare earth elements may begin with uranium (At. No. 92) and contain neptunium (At. No. 93), plutonium (At. No. 94), americium

(At. No. 95), curium (At. No. 96), berkelium (At. No. 97), and californium (At. No. 98).

Rarotonga. Largest of the Cook Islands, in the Pacific Ocean. Of volcanic origin, it is the most fertile in the group exporting citrus fruits, tomatoes, and copra. The mountainous interior, 3,000 ft., is forested, and a belt of alluvial soil, 1 to 3 m. wide, stretches inland from the coast. It is 20 m. in circumference. Avarua is the seat of administration. The island was annexed to N.Z., 1901. Pop. 5,573

Raschette Furnace. Type of blast furnace formerly used for smelting lead, copper, and silver. It was invented by a Russian mining engineer, Vladimir Raschette, in 1862 and was used first in the Upper Harz region of Germany, and later in America. It was a forerunner of the modern types of blast furnaces in its use of cooling water jackets round the body of the furnace shaft and tuyeres. *See* Furnace; Smelting.

Rashid, ALI EL GAILANI (b. 1889). Iraqi politician. Educated at a Turkish law school, he occupied various ministerial positions during the 1920s, becoming chief of the royal bureau and private secretary to Feisal I in 1932, and prime minister the following year. Minister of the interior 1935-36, he was exiled after an abortive coup, but again became premier in 1940. Sympathy with the Axis led him to refuse a British request that Iraq should sever relations with Italy. Rashid resigned, but, after deposing the regent, Ameer Abdul Illah, re-established himself as premier and instigated a revolt. This collapsed, and he fled to Persia, then to Berlin. In 1942 he was condemned to death in his absence by the Iraqis. After the defeat of Germany in 1945 he was refused admittance to Switzerland, and later arrived at Beirut secretly as a stoker in a French steamship. Then in Saudi Arabia he was given sanctuary, King Ibn Saud announcing that he was regarded as a refugee. *See* Iraq.

Raskolniki. Russian word meaning schismatics, used as a general term for all bodies which dissent from the Orthodox Church. Such sects have been numerous in Russia, most of them dating from the 17th and 18th centuries. Russian dissent is eminently conservative, and usually marks a resistance to some reform or change, often trivial, in the Orthodox Church. Thus sects have arisen over the question of how many times the Hallelujah was to be re-

peated in the service, or how many fingers should be used in making the sign of the Cross.

Rasmussen, KNUD JOHAN VICTOR (1879-1933). Danish explorer. Son of a missionary whose wife was of Eskimo descent, he was born in Greenland, June 7, 1879, and began exploring the Arctic regions in 1902, eventually becoming the chief authority on Eskimo life and language.

Knud Rasmussen,
Danish explorer

He described his early expeditions in *The People of the Polar North*, 1908, and his travels of 1912-20 (into Peary Land) in Greenland by the Polar Sea, 1921. Between 1921 and 1925 he carried out his principal exploration, making an ethnographical survey of the Eskimo people, discovering relics of Franklin's expedition, and reaching Alaska and Siberia. His death was announced Dec. 22, 1933.

Rasp. Coarse variety of file, having separate teeth formed by the use of a pointed punch. The teeth are raised and pointed, so that they are adapted for abrading wood, horn, bone, and similar non-metallic substances. Wood rasps are made in two or three degrees of coarseness, and in flat, half-round, or round sections. The cabinet rasp, for hardwood, is made in two finer cuts, half-round shape. Rasps are used by farriers for trimming horse-hoofs, and by shoe repairers and leather-workers. The horse rasp and shoe rasp are flat and double-ended and have different cuts of teeth at their opposite ends. *See* File.

Raspail, FRANÇOIS VINCENT (1794-1878). French scientist and politician. Born at Carpentras, Jan. 25, 1794, he was educated for the Church, but refused to take orders. He studied and taught physics in Paris, and was active in advanced political circles, being president of the Amis du Peuple. He was imprisoned in 1830, and later worked on chemical research, publishing his *Système de Chimie Organique*, 1833. In 1848 he proclaimed the republic in Paris, but was sentenced to five years' imprisonment, 1852. He sat as deputy for Lyons, 1869, and for Marseilles, 1876, and died at Arcueil, Seine, Jan. 7, 1878. His medical researches on antiseptics and the decay of tissues anticipated the discoveries of Pasteur.

Raspberry (*Rubus idaeus*). Shrub of the family Rosaceae. Natives of Great Britain and other European countries, raspberries will thrive in any soil except clay or one that has a clay subsoil. The canes should be planted in autumn or spring, at a distance of two ft. apart, and four ft. between the rows. As they require some support, they thrive best if trained to wires stretched horizontally at intervals of 18 ins. above the ground.

After planting, the canes should be cut down to within six ins. of the ground, and a dressing of well-rotted manure applied to the sur-

Raspberry. Cane in bloom, and, above, fruit (left) and leaf

face of the earth as a mulch. Young canes are produced during the course of the year, but these should be limited to three or four from each parent plant. As fruit is borne only on one-year-old canes, the old wood should be cut away ruthlessly at the end of each season, and the young canes reduced to about one foot in height. The principal disease, raspberry spot, may be dealt with by spraying the canes with a weak solution of copper sulphate, or Bordeaux mixture. Raspberries are shallow-rooting subjects, hence, in preparing ground for their reception, it is always advantageous to keep the best of the soil nearest to the surface. By way of summer stimulant superphosphate of lime or nitrate of soda may be applied, and liberal doses of liquid manure during the period of the ripening of the fruit.

Rasputin, GREGORY (1873-1916). Russian fanatic. Generally called Rasputin, which

Gregory Rasputin, Russian fanatic

means the immoral, his real name was Novikh, and he was born at Pokrovsky, Siberia, the son of a fisherman. He received no education and only in his later years learned to write a scrawling hand.

He began life as a fisherman, but when a very young man became a professional pilgrim and actually acquired the reputation of a saint. In 1905 he was in fashion as a "holy man" in Moscow, and among his devotees were many women, over whom he appeared to exercise a hypnotic power. In the same year he went to St. Petersburg, appeared as the creator of a new religious cult, and gained an influence at the Russian court, which was much increased by the tsarina's belief in his ability to cure and keep cured the tsarevitch, her ailing son. Gradually he acquired a commanding position among the reactionaries or "dark forces," and made and unmade ministers, while continuing the dissolute life which had given rise to the name by which he was popularly known. Banned to Siberia, on his denunciation by Milyukoff in the Duma in 1913, he returned to St. Petersburg soon after the outbreak of the First Great War, was received with renewed favour by the tsarina, and again became a sinister political figure. On Dec. 29, 1916, he was assassinated in Petrograd by some highly placed Russians. Consult Fulöp-Miller, 1932.

Rassam, HORMUZD (1826-1910). Archaeologist. He was born at Mosul, his father being a clergy-

man of the Chaldean Church. Having assisted Layard in his excavations, he studied at Magdalen College, Oxford, afterwards returning to his archaeological work, during which he discovered the palace of Ashurbanipal, at Nineveh. In 1854 he was made British resident at Aden, and in 1864 he was sent to Magdala,

where King Theodore imprisoned him until he was released by Napier's expedition. Later, he worked for the British Museum, in Mesopotamia. Rassam died at Hove, Sept. 15, 1910.

Rasselas. Philosophical tale by Samuel Johnson, published in 1759 with the full title of *The History of Rasselas, Prince of Abyssinia*. It consists mainly of musings and moralisings on human life, linked by the thread of story of Rasselas confined to the Happy Valley, of his attempts to leave it, and of his subsequent wanderings.

Ras Shamra. A north Syrian coast site where excavation by a French expedition during the 1930s revealed a Bronze Age town. A Canaanitish people, predecessors and perhaps ancestors of the Phoenicians, settled here during the third millennium B.C., and their town, Ugarit, soon became an important centre of E. Mediterranean and Asiatic trade. Its maximum prosperity was when Egypt, with which it did much trade, was strong enough to enforce the security of Syria. Among the inscribed tablets found are some with a rudimentary cuneiform alphabet. The chief gods were Dagon and Baal. Groups of foreign merchants settled in the town and in the 13th century B.C. it was dominated by a colony of Achaeans.

Rastatt or **RASTADT**. Town of Baden, Germany. It stands on the Murg, 3 m. from its union with the Rhine, and 14 m. from Karlsruhe. The chief building is the palace, built on the model of the one at Versailles and formerly the residence of the margraves of Baden. A small place then, Rastatt was destroyed by the French in 1689, soon after which the margrave of Baden rebuilt and fortified it. It was, until 1871, one of the strongest fortresses between France and Germany. Pop. est. 14,000.

The peace of Rastatt was a preliminary of the treaty of Utrecht. Made between France and Austria in Nov., 1713, it put an end to the war of the Spanish Succession. In 1797 another peace conference was held here. This had no result, but was notable because two of the French envoys were murdered. The reasons for the crime are obscure. (See Utrecht, Treaty of).

Rastatt was captured from the Germans on April 12, 1945, by units of the French 1st army. After the end of the war it came within the French zone of occupation.

Hormuzd Rassam, archaeologist

Rat. Term applied to many rodents of the family Muridae, which includes the mice, rats, hamsters, voles, lemmings, and many others. The largest group of the rodents,

Rat. Black rat and, above, the brown rat, two British species of the rodent
W. S. Berridge, F.Z.S.

it is world-wide in distribution. Nearly all the animals of this family have naked and scaly tails, narrow incisor teeth, not more than three pairs of cheek teeth in each jaw, and usually live in holes in the ground. The rats proper are found naturally only in the Eastern Hemisphere. Great Britain possesses two species, the black rat and the brown rat.

The black rat is shorter in body than the more familiar brown species, but has a longer tail. Its hair is greyish black on the upper parts and pale yellow below, while in certain of the Channel Islands a bluish variety occurs. The tame white and pie-bald rats, which have probably been bred in a domesticated state for at least two centuries, are said to be descended from this species. The brown rat is a native of Trans-Baikal, and migrated till it reached England about 1730. It is larger and more heavily built than the black rat, and is much more ferocious in disposition, and on reaching Great Britain soon exterminated the older species in most districts.

Rats prefer the neighbourhood of human dwellings and farms on account of the ease with which food may be obtained. They are omnivorous. They are amazingly prolific, several litters of from four to ten young ones being produced each year. Apart from the food they consume, rats do great damage by burrowing and by making holes in drain-pipes. The species of flea which infests rats carries bubonic plague.

The control of rats is now considered a matter of importance, and a campaign was opened in 1943 against the rats in the London sewers—the first of its kind. More than 500,000 were destroyed in the first fortnight. The attack was made in 3,000 miles of sewers.

Under the Prevention of Damage by Pests Act, 1949, local authorities must free their districts from

rats so far as is practicable. Occupiers of land must notify them if rats are on their land in substantial numbers and

may be legally compelled to destroy them. See Beaver Rat; Pouched Rat.

Rata (*Metrosideros robusta*) OR

IRONWOOD. Tree of the Myrtaceae, a native of New Zealand. It has opposite, glossy, oval leaves, and clusters of bright red flowers. The hard, close-grained wood, useful for shipbuilding, is used by the Maoris for making boat-paddles and war-clubs.

Ratafia. Generic name for cordials or liqueurs made from, and flavoured with, cherries, almonds, apricots, peaches, nectarines, or plums. The crushed kernels as well as the flesh of the fruit are steeped in the spirit, which is afterwards distilled. *Pron.* ratafeeaa.

Ratchet and Pawl. Device which permits one part of a machine to move another, if turned in one direction, without affecting it if turned in the other direction. The ratchet, the part to which power is applied, is provided with teeth, perpendicular on one face, and usually sloping on the other. The pawl is a catch

Ratchet and Pawl.
A. Ratchet wheel.
P. Pawl. L. Pawl operating lever.
F. Fixed pawl or catch

pivoted at one end to the lever, etc., through which power is applied, and suitably shaped at the other to engage the steep faces of the ratchet, against which it is pressed by its own weight, a spring, or some other device. A good example is found in the free-wheel of a bicycle. When this is dragged round by the chain in one direction the pawls engage with the ratchet teeth on the hub of the driving wheel. If it is turned in the other direction, or if the chain wheel is stationary while the driving wheel is running forward, the pawls merely click over the teeth. Another notable

instance is found in the winding mechanism of a clock.

Ratcliffe, SAMUEL KERKHAM (b. 1868). British journalist and author. He early made a name in journalism, being editor of *The Echo* in 1900, and acting editor of *The Statesman*, Calcutta, 1903-06. Later he became well known as a lecturer in the U.S.A., especially on India affairs, and spoke to ethical societies and other organizations in the U.K. Among his numerous books are *The Roots of Violence*, 1934; *The Resurgence of Asia*, 1946.

Rata or Ironwood. Flower cluster and leaves; inset, single flower showing stamens

Ratcliff Highway. Old name of part of The Highway, Stepney, London, E. It runs E. from Upper East Smithfield, continuing to Narrow Street, N. of the London Docks. It was notorious in 1811 for a series of murders which threw London into a panic; they are referred to by De Quincey and Macaulay. Here Charles Jamrach (*q.v.*), founder of the firm of dealers in wild animals, set up in business about 1840. Near by is the church of S. George's-in-the-East, designed by Hawksmoor, completed 1879, rendered derelict by bombs in the Second Great War, and standing in a recreation ground. In Swedenborg Square is the Swedish church, built 1728; in the adjacent Wellclose Square, the Seamen's day schools for children, on the site of a Danish church, 1696-1869.

Rate. Term used in the U.K. for a charge made by a local authority on occupiers of property in its area, the proceeds being used to meet local expenditure. Rates are distinguished from taxes, which are imposed by the state for the purpose of meeting national expenditure. Rates arose when the Poor Relief Act of 1601 made each parish responsible for the support of its poor. The administration of this poor rate was placed in the hands of overseers of

the poor in each parish. The system then set up remained substantially unchanged for more than 300 years, except in London where new rating machinery was introduced in 1869.

The Act of 1601 imposed liability on the inhabitants, parson, and vicar of the parish and every occupier of lands, houses, tithes, coal mines, or saleable underwoods. For long persons were liable on their trading profits as "inhabitants," even though they were not occupiers of any property in the parish; but this liability ended in 1840. By various Acts passed in the 19th cent. all woods and mines, and sporting rights and advertising stations, were added to the list of rateable property until all land and buildings were included. Crown property is exempt.

Valuation of Property

The overseers had to estimate what each occupier of property in each parish could pay, and as a basis they took the annual value of the property—i.e. the sum for which it could be let to a yearly tenant. Until 1862 it was not compulsory to prepare valuation lists. As new local authorities were created with new duties, e.g. public health, they were given power to make a rate for the purpose of raising any money required. By the time of the First Great War the rating system of the country was chaotic. In some parishes no complete valuation list had been prepared for nearly half a century, and there were wide discrepancies between the values placed on similar properties even in the same parish. The provisions for the making of the rate were in equal confusion. The overseers made the poor rate in each parish; C.C.s made a co. rate; and co. bor. councils, urban and rural dist. councils, and other bodies could all make different rates for different purposes.

The increased provision of social services after the First Great War, and the consequent increase in the rates, made these defects more obvious, and the whole rating system was completely recast by the Rating and Valuation Act, 1925, which reduced the number of rates levied to one in urban dists.—the general rate—and two in rural dists.—the general rate and a special rate. The parish ceased to be the unit of rating and the councils of bor., urban, and rural dists. became the rating authorities. Other bodies, such as C.C.s, who required money to meet their expenses were given

power to make precepts to these rating authorities requiring them to raise the money by means of the rates made by them. To secure greater uniformity of assessment, the area of assessment was enlarged. Each co. bor. became an assessment area, and outside these bors. the dists. were grouped into special assessment areas. Valuations were to be made every five years. By the Local Government Act, 1948, valuations were taken out of the hands of the local authorities and placed in those of Inland Revenue officers, appeal being allowed to local valuation courts. This Act sought to equalise the burden of rates throughout the country by permitting grants where necessary from the Exchequer. New lists were to come into force in 1952.

Rates are charged on the rateable value of property, which is calculated from the net annual value, itself in some cases calculated from the gross value. The gross value of land (other than agricultural land) with or without buildings, and of houses and buildings without land (other than gardens), must be arrived at. The gross value of such properties was, until the Local Government Act, 1948, the rent at which the property might be let from year to year on the terms that the landlord paid for repairs and insurance, and the tenant paid the tenant's usual rates and taxes.

Modifications of 1948

The Local Government Act, 1948, altered the basis of calculations for dwelling houses. The gross value of houses built after 1918 by a local authority or housing association was to be arrived at by taking 5 p.c. of what it would have cost to build the house in 1938 and adding to it 5 p.c. of the value of the site in 1938. The gross value of post-1918 dwelling-houses not built by a local authority or housing association, but whose rateable values did not exceed £100 in London or £75 elsewhere in April 1939, was arrived at in the same way, except that the site value in 1949 was taken. This last provision does not apply to a flat or maisonette. The gross value of other houses is to be estimated by reference to the rents being paid for comparable dwelling houses on Aug. 31, 1939, let on the terms that the landlord pays the cost of repairs and insurance and the tenant pays the usual tenant's rates and taxes. For all the above properties a deduction is made from the gross value, varying from 5 p.c. to

40 p.c. of the gross value according to the nature of the property, in order to arrive at the net annual value. This is normally also the rateable value.

The gross value of, e.g., factories, is not calculated, the net annual value being arrived at directly by estimating the rent at which the property might be let from year to year if the tenant paid the tenant's usual rates and taxes and also the cost of repairs and insurance. The rateable value is in this case also usually the same as the net annual value. There are special provisions for calculating the rateable value of properties of a special nature—e.g. gas or waterworks.

Examples of Derating

Another development after the First Great War was the derating of certain properties, i.e. the partial or complete exemption of certain properties from liability to rates with the object of assisting agriculture and industry. In 1928 all agricultural land was derated, and business premises and rlys., canals, and docks were relieved of 75 p.c. of their liability. The Local Government Act, 1948, provided that nationalised rlys., canals, and electricity undertakings should not be rated, but that instead the British Transport commission, the British Electricity authority, and other electrical authorities should annually make payments for the benefit of local authorities, the payment consisting of a fixed standard amount plus a sum varying each year with the average of the rates throughout the country. For England the standard amount paid by, for example, the British Transport commission is £1,810,000, and by the British Electricity authority £11,250,000.

The rates are normally payable by the occupier, but the rating authority may by resolution make the owners of houses of low rateable value liable, and the owners of any houses, whatever the rateable value, may make an agreement with the rating authority to pay the rates.

The year for rating purposes ends on March 31. A rate is payable as soon as it is made, even though it has not been demanded, but proceedings for recovery cannot be taken until seven days after a demand has been made. Rates may be recovered by distress on a warrant from two justices. When there are not sufficient goods to pay the rate the person liable may be im-

prisoned for up to three months by order of two justices if they consider his failure to pay was due to wilful refusal or culpable neglect. A rating authority may reduce or remit the payment of any rate on the ground of the poverty of the person liable. A discount up to $2\frac{1}{2}$ p.c. may be allowed for prompt payment. In London the system of rating differs in some respects.

Ratek OR **RATACK**. Chain of 13 coral atolls in the Pacific Ocean. With the parallel chain of the 11 **Ralek** or **Ralik** atolls, it forms the Marshall Islands. **Ratek** is the E. or sunrise chain, and **Ralek** the W. or sunset one. See **Marshall Islands**.

Ratel (*Mellivora*). Genus of carnivorous mammals, related to the badger, and found in India and S. Africa. Contrary to the usual rule of coloration, their upper parts are light grey and the under ones black. They have stout bodies and short

Ratel. Example of the burrowing carnivore, allied to the badger
W. S. Berridge, F.Z.S.

legs and tail. They live in burrows, and feed by night upon small birds and mammals, and honey.

Rath. Ancient Irish hill-fort. An earthen embankment, usually round, often stake-fenced, it protected, in the larger examples, the residence of a chief and his dependents. Nearly 30,000 remain, and the term enters into 700 place-names, e.g. **Rathlin**, co. Antrim. Naas **rath**, co. Kildare, was the seat of the Leinster kings.

Rath OR **RATHA**. Hindustani name of several monolithic temples at Mahabalipuram, 30 m. S. of Madras, on the Coromandel coast of India. Carved out of granite boulders, presumably in the 7th century A.D., and now deserted Hindu shrines, they are interesting as representing in miniature the Buddhist architecture of their time. See **Mahabalipuram**.

Rathbone, **BASIL** (b. 1892). British actor. Born at Johannesburg, June 13, 1892, he was educated at Repton, and made his first stage appearance in Benson's company at Ipswich, 1911. He toured the provinces and the U.S.A. in *Shakespeare*, and, after serving in the First Great War, established a reputation in a revival of *Peter Ibbetson*, 1920, and as *Iago* in *Othello*. Other

London successes were in *East of Suez*, and *R.U.R.* On the American stage **Rathbone** appeared with *Ethel Barrymore* in *Heat Wave*, 1931, and played *Romeo* to the *Juliet* of *Katherine Cornell*, 1934. He entered films in America in 1925, and was outstanding as *Murdstone* in *David Copperfield*, as *Karenin* in *Anna Karenina*, and as *Sherlock Holmes* in a long series of films.

Rathbone, **ELEANOR** (1873-1946). British politician. Daughter of **William Rathbone** (who helped to found **Liverpool** university), she was born in **Liverpool** and educated at **Kensington** high school and **Somerville College**, **Oxford**. She helped to start the dept.

of social science at **Liverpool** university, and was the first woman member of that city council and first woman J.P. in **Lancs**. A worker in the cause of woman suffrage, in 1929 she became Independent M.P. for the **English** universities; she was returned unopposed in 1935 and elected again in 1945. Family allowances were a strong point in her political programme; she published *The Disinherited Family*, 1924, and *The Case for Family Allowances*, 1940. She died Jan. 2, 1946.

Rathenau, **EMIL** (1838-1915). German capitalist. Born of Jewish parentage in **Berlin**, Dec. 11, 1838, he was trained as an engineer at **Hanover**, **Zürich**, and with an **English** firm. In **Berlin** he started a foundry of his own. This was not a success but after years of wandering over the world, **Rathenau** in 1881 took up **Edison's** incandescent lamp invention, and formed a company to work it in **Germany**; soon he did the same for the telephone, and in 1887 his firm became the **General Electric Co.** **Rathenau** supplied **Berlin** with electric light and various towns with tramways, himself being engineer, merchant, manufacturer, and banker. He died, June 20, 1915. *Pron.* Rah-ten-ow.

Rathenau, **WALTHER** (1867-1922). German politician, son of the above **Emil Rathenau**, whom he succeeded as president of the **General Electric Co.** In the First Great War he was in charge of supplies of raw material. In 1921 he was minister of reconstruction and tried to persuade the Allies to

undertake the economic rebuilding of **Russia**. The treaty of **Rapallo** (q.v.), 1922, was partly his work while foreign minister. On June 25, just as a more tractable mood was appearing in German policy, he was assassinated.

Rathenow. Town of E. Germany, in the *Land* of **Brandenburg**. It is on the river **Havel**, 43 m. W. by N. of **Berlin**, and has possessed urban rights from 1295. It has a church, now Protestant, dating back to the 13th century; and a statue of the Great Elector, who here defeated the Swedes in 1675. One of the centres of the German optical industry, it had engineering works and was a rly. junction and a garrison town. Captured by the Russians, April 27, 1945, it lay after the Second Great War in their zone of occupation. Pop. 45,000.

Rathfarnham. Town of co. **Dublin**, **Eire**. It stands on the **Dodder**, $3\frac{1}{2}$ m. S. of the capital. The chief industries are paper making and corn milling. There is a 16th century castle, long the property of the **Loftus** family.

Rathlin OR **RAGHERY**. Island of N. Ireland. Off the N. coast of **Antrim**, it is 5 m. N. of **Ballycastle**. It consists of a strip of land about 4 m. from W. to E. and a shorter one running S. from the E. end; has a breadth of $1\frac{1}{2}$ m.; and reaches an alt. of 448 ft. S. **Columba** founded a church here in the 6th century, and **Robert Bruce** found refuge on the island in 1306; the remains of **Bruce's Castle** occupy a position in the N.E.

Rathmines. Southern suburb of **Dublin**, **Eire**, having a rly. station. It occupies in part the site of the **Bloody Fields**, scene of the massacres of **English** colonists on **Easter Monday**, 1209. Here on Aug. 2, 1649, **Cromwell's** commander **Michael Jones** defeated **Ormonde**. **Limestone** is quarried. Pop. (**Rathmines** and **Rathgar** urban dist.) 40,000.

Ratibor (Pol. *Racibórz*). Town of Upper **Silesia**, 88 m. S.E. of **Wrocław**, it is situated on both banks of the **Oder**. There are a former ducal palace, the R.C. church of S. Mary (15th century), and a column to the **Virgin** (1723). A rly. junction and shipping centre, **Ratibor** had law courts, theatre, libraries, museum, and industries in electrical engineering, ship-building, hat making, and food production. It was the capital of a small principality of the same name from 1282 to 1532; fell to **Prussia** in 1742; and was subsequently held as a fief by several dispossessed smaller dynasties

which held the title of duke of Ratibor. Overrun by the Russians in Jan., 1945, after the Second Great War it lay in the area of Germany placed under Polish administration. Pop., 1939, 51,729.

Rating. Name given in the British navy to anyone belonging to the lower deck. Sailors are rated as able seamen, petty officers, etc. Hence, obtaining promotion is commonly spoken of as picking up a rate. Rate as applied to a vessel means her classification.

Ration and RATIONING. Terms which originally referred to the fixed daily allowance of provisions assigned to a soldier or sailor for his subsistence. Since the earliest days of organized warfare, compulsory restrictions on the individual consumption of food by civilians have been a common practice amongst besieged communities, but the general rationing of food for civilian populations was first introduced on a national scale by the belligerents in the First Great War. In 1903 the British govt. appointed a royal commission to examine the conditions of food supply and distribution likely to obtain in the event of a major war; in its report in 1905 the majority gave the opinion that no enemy would be able to impose on the British Isles a blockade capable of preventing the adequate import of foodstuffs, but a minority pointed out that there was rarely more than seven weeks' supply of grain in the country at one time.

Before the end of 1914, the First Great War had restricted, even disrupted, the normal distribution and supply of food, and shortages became an acute problem to the belligerent countries. Germany and her allies were obliged to adopt a system of food rationing early in 1915. The British govt. was at first concerned with rationing the armed forces only, but with the intensification of the German submarine campaign in 1916, the food situation became acute, while scarcity and bad distribution led to queueing and discontent. A food controller was appointed, then a ministry of Food (*q.v.*) was set up. In 1917, the govt. took over the supervision of all flour mills, while the food controller exhorted people to ration themselves according to specified amounts. The exhortations being generally futile, it became necessary to institute a comprehensive system of direct rationing. The first commodity rationed was sugar, followed by butter, margarine, lard, meat, ham,

jam, cheese, and tea. Each consumer was given a card containing coupons valid for a specific amount of each rationed food; he had to register with a particular retailer. Prices of all commodities were not, however, fixed by the govt., and much profiteering resulted.

Rationing measures in Great Britain in the Second Great War were more prompt and thorough. For some time it had been appreciated that for rationing to be effective it must be imposed before and not after a shortage had arisen. By 1938 ration books for the whole population had been made ready for issue; the country was split into 18 divisions, each under a divisional food officer. Local committees to a total of 1,500 for England and Wales were made responsible for registering all retailers, regulating supplies, and stabilising prices. Orders controlling stocks, imports, and prices of staple foods were brought into operation in September, 1939, to be extended later to virtually all foods and feeding stuffs. The ministry of Food operated wherever possible in conjunction with or through existing traders.

From January 1940

Rationing began in Jan., 1940, with butter, bacon, and sugar, and subsequently covered, in one form or another, meat, most groceries, sweets, and soap, while distributional allocations were introduced for milk, eggs, imported fruit, and other perishable goods. Every consumer had his ration book, and it was an offence to obtain or supply more than the permitted quantity. The consumer was required to register with a retailer for meat, fats, bacon, jams, sugar, eggs, cheese, and milk. The ministry accepted guidance from experts in nutrition and medical advisers. For some foodstuffs, a system of Points Rationing (*q.v.*) was used. Certain foods, *e.g.* milk, oranges, bananas, and also fuel came under distributional schemes less rigid than direct rationing.

Five types of ration book were issued: R.B.1 (buff), for civilians over 18; R.B.2 (green), for children under school age with special coupons for vitamin foods (cod liver oil and orange juice) and none for tea; R.B.4, the adolescent's ration book (blue), entitling the holder to the same quantities of rationed and controlled foods, except bread and milk, as holders of R.B.1; R.B.6, seamen's weekly ration book; R.B.7, for expectant mothers (grey) with additional coupons for milk, eggs, and cod

liver oil. These books were supplemented by documents, *e.g.* R.B.12, which allowed temporary rations to persons away from home for short periods, service personnel on leave for more than 72 hours, and commercial travellers.

After the war, with the world food situation deteriorating because of war damage, mass movements of population, shipping shortage, and widespread droughts, rationing was retained in Great Britain. Not only were some rations reduced below the wartime level, but foodstuffs which had been purchased freely in the war were rationed: bread during 1946-48, while in 1947 potatoes came under a distributional scheme. (*See Food Control.*)

Food rationing became almost universal in the war, even non-belligerents being affected. All members of the British Commonwealth had their schemes. The U.S.A. rationed coffee and sugar in 1942; other goods were put on coupons. By 1948, however, the U.S.A., the U.S.S.R., Switzerland, Sweden, and Belgium had abolished or eased rationing.

The board of trade introduced clothes rationing in June, 1941, eventually with a special ration book. Goods, including cloth, hand-knitting yarns, garments, and footwear, were listed in a schedule which specified the appropriate number of coupons to be surrendered for each item. The retailer had to give a similar number of coupons to his wholesaler when replenishing stock. After a partial reduction, 1948, all forms of textiles were taken off the ration 1949. *See Petrol Rationing.*

Rationalisation. A term in economics to indicate that production, distribution, and transport methods are applied so as to ensure the minimum waste of effort or materials. It first came into common use in Germany in the period of inflation following the First Great War to denote the organization German industry must accept to survive dissolution. When depression spread to other countries, the term was universally accepted to mean industrial reorganization. In its simpler form, rationalisation of one particular industrial undertaking implies the use of labour-saving and mass-production methods, up-to-date machinery, and scientific research. The clothing, footwear, motor, and radio industries are examples.

In its more complex form, rationalisation entails the amal-

gamation of a group of related industries, setting up common selling agencies, and agreements to fix prices and control output. Theoretically this means bringing the technique and machinery of all establishments in the group to the level of the best, and so ordering their activities that they are able to gauge the present and future needs of the market. In practice, however, a rationalised industry may tend to become monopolistic; the term may be used to justify high prices, control of markets by the manipulation of shares, and elimination of weak opponents outside the combine by underselling. Politically, rationalisation of industry is generally accepted as the capitalist counter to Socialist nationalisation—the distinction between the two systems is that whereas a rationalised industry works for private profit and may have to meet competition, the nationalised industry does not require to make profit, eliminates competition, and may pass its trading losses directly to the taxpayer or indirectly to the purchaser.

Rationalism (Lat. *ratio*, reason). In philosophy, the theory that reason is the chief, if not the only, source of knowledge. It is opposed to empiricism (*q.v.*) and sensationalism (*q.v.*). According to the rationalist, reason is an original faculty which supplies us with concepts and first principles, different from the data of sense, which make it possible to go beyond sensible knowledge and attain the reality of things. While some regard these concepts as innate in the mind, others regard them as immediately discerned by the mind, as intuitive principles.

The rationalism of Kant, while asserting the existence of certain *a priori* (*q.v.*) principles due to reason alone, at the same time admits that reason can know nothing without the aid of experience, beyond the limits of which it can never go. Herbert Spencer, while granting that certain notions such as space and time, are *a priori* as far as the individual is concerned, considers them to be in reality the result of cumulative experience. In theology, rationalism, as opposed to super-naturalism, is the system which interprets all religious belief and dogma in the light of reason, rejecting the authority of tradition and revelation. This line of thought, first systematised by Spinoza, came into special prominence during the struggle between deism and ortho-

doxy, between the supporters of natural and supernatural religion in the 18th cent. See Freethought.

Lecky, new ed. 1910; History of Freedom of Thought, J. B. Bury, 1913; Rationalism and Humanism, J. A. Hobson, 1933; Man His Own Master, A. Robertson, 1948; Men Without Gods, H. Hawton, 1948.

Rationalist Press Association. Educational and propagandist organization. It was founded in 1899 by C. A. Watts, with 94 members and other subscribers

Rattan. Foliage and fruit

who wished to develop the propaganda of rationalism (*v.s.*) by wide circulation of books at low prices. This aim it achieved, before the First Great War, by the issue of sixpenny reprints of the works of Darwin, Huxley, etc., which circulated in huge numbers, and later by the Thinkers' Library, which has included both the classics of rationalism and new books on scientific and philosophical subjects, specially written for the series. The association organizes lectures and publishes periodicals. By 1947 the number of subscribers was over 5,000. The offices of the association are at 4, 5, and 6, Johnson's Court, Fleet Street, London, E.C.4.

Ratisbon. Alternative (French) name of the Bavarian city now usually called Regensburg (*q.v.*).

Ratitae OR **CURSORES** (Lat. *ratia*, raft; *currere*, to run). Division of the zoological class Aves. It includes a number of flightless birds, such as the ostrich, rhea, emu, cassowary, and apteryx. These all lack the keel on the breast bone to which the flight muscles are attached in the flying birds.

Ratlam. Town and former state of India. The state, now part of Madhya Bharat, is drained by the Mahi river. Its area is 687 sq. m. Pop. 126,117. The town is a

noted opium market, 48 m. W.N.W. of Ujjain, and is a rly. junction for Baroda, Indore, Agra, and Ajmer. Pop. 44,000.

Ratnagiri. Dist. and town of India, in the southern division of Bombay state. The dist. lies along the Arabian Sea, and is comprised mainly of the scarp slopes of the W. Ghats. It is without rlys., but is traversed by a N.-S. road. The annual rainfall is 97 ins. Rice is the chief crop. The town is on the coast, almost midway between Goa and Bombay city, and has a very exposed harbour. Sardine fishing is carried on during the early months of the year. Area, 4,069 sq. m. Pop., dist., 1,373,466; town, 18,500.

Rattan (*Calamus rotang*). Reed-like climbing plant of the family Palmae. A native of India, it has large, arching, feather-like, compound leaves, three or four ft. long. The stems of this, *C. viminalis*, and several other species furnish the "canes" of commerce, used for walking-sticks and basket-work, and, when cut into thin strips, for the seats of cane-bottomed chairs. The stems are only an inch or two in thickness. See Cane.

Rattan Palm (*Rhapis flabelliformis*) OR **GROUND RATTAN**. Dwarf palm of the family Palmae. It is a native of China and Japan. The stems are only about three ft. high, growing in dense tufts, rough with the decayed bases of former

Rattan Palm Head with flower sprays and leaves

leaf-stalks. The leaves, which have long slender stalks, are divided almost to the base into five to seven spreading leaflets.

Rattenbury, JOHN ERNEST (b. 1870). A British preacher. Born Dec. 10, 1870, and educated at Didsbury college, Manchester, he entered the Wesleyan ministry in 1893, later starting a successful mission at the Albert Hall, Nottingham. This was afterwards transferred to the W. London mission (founded 1887) with head

quarters at Kingsway Hall, of which Rattenbury was head during 1907-25. He was also president of the National Free Church Council in 1936. His publications, which mainly concerned the application of Methodism to modern problems, included *Sermons on Social Subjects*, 1908; *Wesley's Legacy to the World*, 1928; *The Conversion of the Wesleys*, 1938.

Rattigan, TERENCE MERVYN (b. 1911). British dramatist. Born in London, June 10, 1911, he was

Terence Rattigan,
British dramatist

educated at Harrow and Trinity College, Oxford. He made his reputation as a playwright of wit and originality with *French Without Tears*, a light comedy which, produced in 1936 at the Criterion, London, ran for over 1,000 performances. *Flare Path*, a comedy of the R.A.F., was put on in 1942; *While the Sun Shines*, 1943; *Love in Idleness*, 1944 (acted by the Lunts and produced in New York as *O Mistress Mine*). More serious were *The Winslow Boy* (q.v.), 1946; *The Browning Version*, 1948; *Adventure Story* (about Alexander the Great), 1949.

Rattle. Instrument which makes a rattling noise. There are various kinds, from the toy of ivory or basket work given to babies, to that once used as an alarm by watchmen, and later by the police. This has a vibrating tongue fixed in a frame, which slips over the teeth of a ratchet

Rattle, formerly used as an alarm by police and watchmen

wheel whirled round, making a loud noise. In the Second Great War a rattle was to be used by Civil Defence wardens to give warning of a gas attack from the air.

Rattles. Name applied to plants of three distinct genera—*Rhinanthus*, *Bartsia*, and *Pedicularis*. It belongs properly to *Rhinanthus crista-galli* (yellow rattle), an annual herb of the family Scrophulariaceae, native of Europe, N. Asia, and N. Africa. It is parasitic on

roots, and has lance-shaped round-toothed leaves, and yellow flowers. The inflated calyx remains when the contained seed-capsule is ripe, and, if the plant is brushed against, the seeds make a rattling noise.

Rattlesnake (*Crotalus*). Genus of venomous snakes. It includes about 20 species, all natives of America, mostly of N. America. Like the vipers, to which they are allied, they possess fangs, certain teeth in the front of the upper jaw so rolled upon themselves as to provide a groove down which the poison flows into their wounded victim. In most species the coloration is of a protective character, and their movements when hunting are stealthy. Apparently opposed to this retiring disposition is the possession of the characteristic "rattle" terminating the tail, whose action warns prey of their presence.

This consists of a series of horny cups loosely, though securely, articulated, so that vibration of the tail by shaking them produces the rattling sound, for which various purposes have been suggested. One of its uses—as a sexual call—appears to have been verified, and answering rattles have been heard; but when the snake is hunting it is silent. The most dangerous species is *Crotalus* of N. America, and *C. horridus* of the E. United States. An alternative name for the genus is pit-vipers, suggested by a hollow between nose and eye due to the formation of the jaw-bone (maxilla). See Reptile; Snake.

Ratray. Part of the police burch of Blairgowrie (q.v.) and Ratray, Perthshire, Scotland.

Rauch, CHRISTIAN DANTEL (1777-1857). German sculptor. Born at Arolsen in Waldeck, he studied sculpture under Valentin and Ruhl while valet to the duke of Waldeck. After entering the household of Frederick William III at Berlin, he was enabled to go to Rome. His greatest work was the monument of Frederick the Great at Berlin, unveiled 1851. One may cite also the mausoleum of Queen Louise at Charlottenburg, the Durer monument at Nuremberg,

and statues of the Tsar Alexander, Blücher, and Maximilian of Bavaria. He died at Dresden, Dec. 3, 1857. See Munich; consult also Lives, F. Eggers, 1873-87; and, in English, E. D. Cheney, 1893.

Raudnice or **RAUDNITZ**. Town of Bohemia, Czechoslovakia. It stands on the left bank of the Elbe, 25 m. from Prague. Its castle, built in the 17th century, contains a library of 60,000 vols. and a collection of pictures. The town has some small manufactures. It gave the title of duke to the family of Lobkowitz. Pop. 9,300.

Raunds. Urban dist. of Northants, England. It is 10 m. N.E. of Wellingborough and is served by London Midland region of British

Rattlesnake. 1. Pygmy rattlesnake with young. 2. Texas rattlesnake coiled, with rattle lifted. 3. Rattle of *Crotalus durissus*

W. S. Berridge, F Z S

riys. S. Peter's church has a famous spire, 189 ft. high. It contains some old tombs. The chief industry is the manufacture of boots and shoes. Pop. 4,500.

Rauschning, HERMANN (b. 1887). Danzig politician. He was born at Thorn, W. Prussia, Aug. 7, 1887, and educated at Munich and Berlin universities. After service in the First Great War, he became active in the politics of the then free city of Danzig. He was elected to the Danzig senate as a member of the Nazi party, and was foreign minister of the free city-state government, 1933-34. He was then elected president of the senate, but in 1935 he denounced his party. In 1940 he escaped to Great Britain and afterwards went to the U.S.A., where he wrote such books in denunciation of Nazism as *The Beast from the*

Abyss and The Revolution of Nihilism (both published 1941).

Ravillac, François (c. 1578-1610). Assassin of Henry IV of France. Born at Angoulême, he was a valet and schoolmaster there, later entering a religious order, from which he was expelled. He claimed to have received supernatural visions, and, hearing that Henry IV of France was about to declare war on the Pope, went to Paris and fatally stabbed the king in the rue de la Ferrière, May 14, 1610. He was arrested, red-handed and put to death by torture on May 27, 1610.

Rava Russka. Town formerly in Austria-Hungary, then in Poland, from 1945 in Russia. It is 33 m. N.N.W. of Lvov. An old castle here was later used as a religious establishment. The town gave its name to battles in the First Great War. The best-known was between the Russians and the Austrians, in Sept., 1914, sometimes called the battle of the Grodek line. Rava Russka was included in the Russian zone after the partition of Poland in Sept., 1939, and was occupied by German troops soon after the Nazi attack on Russia in June, 1941. The town was recaptured by units of the 1st Ukrainian army, July 20, 1944.

Ravel, Maurice Joseph (1875-1937). French composer. Son of a Basque mother and Franco-Swiss father, he was born near St. Jean de Luz, March 7, 1875, and studied at the Paris conservatoire, where he was a pupil of Fauré. The overture *Schérazade*, 1899, was one of his earliest orchestral works, and his *Allegro* for strings and harp, 1905, later proved popular. An impressionist, influenced by Debussy, he wrote the music for Diaghilev's ballet *Daphnis et Chloé*, 1909, the ballet opera *L'Enfant et les Sortilèges*; these, and a piano concerto were his main large-scale works. He excelled also at piano compositions, chamber music, and songs. His best known piano works included *Gaspard de la Nuit*, *Jeux d'Eau*, *Pavane pour une Infante défunte*, *Valses Nobles et Sentimentales*, and *Le Tombeau de Couperin*, the last three being later scored for orchestra. His other works included *Ma Mère l'Oye*, *La Valse*, and his most popular piece, *Boléro*. Ravel had

Maurice Ravel,
French composer

the restraint and detachment of the classic school marked by great originality of harmony. He was made director of the Conservatoire Américain at Fontainebleau in 1934. He died Dec. 28, 1937. *Consult* Lives, M. Roland, 1945; N. Demuth, 1948.

Ravelin (Ital. *riellino*). Entrenchment having two faces forming a salient towards the enemy. It is generally used in front of that part of the fortification which has a straight face, but affords a certain amount of flanking and enfilade fire against attacking troops. *See* Fortification.

Raven (*Corvus corax*). Large bird of the crow family. It is found throughout the N. portions of both hemispheres. Its plumage is black with purple reflections, and it is about 25 ins. in length. The beak is notably strong and massive. The raven was formerly c o m m o n

Raven, a bird of
the crow family

throughout Great Britain, but is now found only in mountainous and secluded districts, more especially about the N. shores of Scotland and in the western islands. A few pairs still breed on the rocky coasts of S.W. England and in Wales. This is a powerful bird on the wing and soars high in the air, but it rises from the ground in a slow and flapping fashion.

It begins nest-building in Jan. choosing for the site a ledge on some inaccessible cliff, though occasionally the nest has been found in a tree. The same nest is used year after year, and the birds pair for life. The raven is omnivorous; and all kinds of animal food, eggs, fruit, grain, insects, and grubs are readily devoured. Small lambs and rabbits are sometimes attacked and eaten, but usually only sickly or injured animals are chosen. In captivity the raven makes an intelligent, amusing, but mischievous pet, like Grip in Barnaby Rudge. *See* Eggs colour plate.

Raven, Charles Earle (b. 1885). British theologian and naturalist. Born July 4, 1885, he was educated at Uppingham and Caius college, Cambridge. Ordained in 1909, he became dean and lecturer in theology at Emmanuel college, Cambridge, a position he occupied until 1920. After holding canonries and chaplaincies and being chancellor of Liverpool, he was chosen regius professor of divinity at Cam-

bridge, 1932, and was master of Christ's college from 1939. Apart from his scholarly theological works, Raven was a writer on natural history, e.g. *English Naturalists from Neckham to Ray*, 1947, was awarded the James Tait Black prize. War and the Christian, 1938, was a timely essay.

Raven-Hill, Leonard (1867-1942). British artist. Born at Bath, March 10, 1867, he was educated at Bristol grammar school, and studied art at Lambeth and in Paris under Bouguereau. He first exhibited at the Salon in 1886 and at the R.A. in 1889.

L. Raven-Hill,
British artist

Art editor of *Pick-me-up*, then of *The Butterfly*, which he founded in 1893, he first contributed to *Punch* in 1895, and acted as "second" cartoonist from *Sam-bourne's* death in 1910, until he retired in 1935. With keen sense of character and design, owing much to the influence of Keene, he illustrated Kipling's *Stalky and Co.*, and his last picture in *Punch* showed in colour Kipling as the *Empire's* laureate. Raven-Hill excelled in sporting and boating scenes. He died at Ryde, March 31, 1942.

Ravenna. Prov. of N.E. Italy, in Emilia, and bordering on the Adriatic Sea. A fertile plain, it is low-lying in the coastal district, and marshy in the N. Well watered by streams flowing from the Apennines and intersected by canals, it produces rice, hemp, cereals, oil, wine, and chestnuts. The manufactures include faience ware, glass, paper, silk, linen, and leather articles. Its area is 715 sq. m. Population 284,500.

Ravenna. City of Italy, capital of the prov. of Ravenna. It stands in a marshy plain, between the rivers Fiumi Uniti and Lamone 6 m. from the Adriatic, 44 m. by rly. E.S.E. of Bologna. It is still surrounded by old walls which were once washed by the waters of the Adriatic. Of very ancient origin, it is second only to Rome, in the importance of its early Christian art, unrivalled in the West as a place for studying Byzantine culture, and for 350 years was virtually the capital of Italy. Its archbishopric was founded in 493, and its cathedral dates from the 4th century. Other old churches are those of S. Giovanni Evangelista, dating from 425; S. Vitale, 520; S. Apollinare in Classe, 535;

S. Apollinare Nuovo, 500; the mausoleum of Galla Placidia, 440, notable for its mosaics; the Orthodox Baptistery, 450. The old city castle, partly demolished in 1735, is in the N.E. quarter.

Except S. Vitale, all the churches named were damaged by bombs in 1944, for Ravenna was near the Gothic Line and was taken Dec. 4, 1944, by British and Canadian troops of the 8th army. S. Apollinare in Classe was also shelled by the retreating Germans. But the mosaics of Justinian's and Theodora's time and other works of art almost entirely escaped damage.

Of the important Roman structures nothing now lies above ground. Deserted by the sea and shrunken from its former greatness, Ravenna contains a museum of Roman and Byzantine antiquities, the tomb of Dante, and a valuable library. Manufactures include musical instruments, silk, lace, glass, and wine.

In this famous fortress, protected by marshes, Honorius sought refuge from 404. Odoacer held it for three years against Theodoric, and in 539 it was once more captured by Belisarius. Ravenna was the seat of the exarch of the Eastern emperor until 750. Later it was held by Venice and the popes, remaining under the sway of the latter until 1859, when it became Italian. Near the town is an obelisk to the memory of Gaston de Poix, who fell in battle here after defeating the papal and Spanish forces on April 11, 1512. Byron lived here with the Countess Guiccioli. See Darte.

Ravensbrück. Nazi concentration camp in the former province of West Prussia. Reserved for women, it was the scene of torture, experimentation, and extermination. In 1946 the camp leaders and a number of assistants, male and female, were sentenced by an Allied tribunal to death, or to long terms of hard labour.

Ravensburg. County town of Württemberg, Germany. It stands on the Schussen, 11 m. N.N.E. of Friedrichshafen, consists of the old town and modern suburbs, and is encircled by

Ravenna, Italy. The cathedral, which dates from the 4th cent. Above, interior of S. Apollinare Nuovo, dating from 500

medieval fortifications. The most important buildings are Our Lady's church, 14th century, the 14th century Rathaus, and the Veitsburg tower, which stands on the site of the old castle of the Guelphs. The industries include weaving and dyeing, and there are

manufactures of machinery, paper, stained glass, and a trade in wine, wood, and cattle. Ravensburg belonged to the Hohenstaufens in 1180, became a free city 1276, and passed to Württemberg 1810. In 1945 it came within the French occupation zone. Pop. 24,100.

Ravenscar. Seaside resort of the N. Riding of Yorkshire, England. Formerly known as the Peak, it is set on a plateau above crags of 600 ft., forming the S. spur of Robin Hood's Bay. Its only large building is an hotel with ornamental gardens, and there is a golf course. There is a rly. station on the Scarborough-Whitby line.

Ravenscourt Park. London district and park, in the W. of the bor. of Hammersmith. The park, 32½ acres, from which the dist. takes its name, was in 1887 acquired by the local vestry and met. board of works for £58,000, and passed under the control of the L.C.C. in 1889. Since 1887 about one acre has been added. E. of the ornamental lake was Ravenscourt Mansion (destroyed in 1941 by a German bomb), an 18th century successor to the ancient manor house of the manor of Paddenswick or Palingswick, a gift of Edward III to his favourite,

Alice Perrers or de Windsor (d. 1400), and commemorated in the name of the adjacent Paddenswick Road. The park has an avenue of flowering cherries leading from the King Street entrance, a bowling green, tennis courts, children's playground, and an old English garden, containing every flower mentioned in Shakespeare's works. Close to the park is the Royal Masonic Hospital, opened, 1933, by George V. Ravenscourt Park gives its name to a London Transport rly. station.

Ravenspur. Ancient seaport of Yorkshire. It stood near Spurn Head, and in the 14th century was a prosperous seaport. It was represented in parliament, and here, in 1399, Henry IV landed. Soon, however, the sea began to encroach, and by 1500 the place had disappeared.

Ravenswood. Town in Kennedy district, Queensland, Australia. It is the terminus of a short branch line from the Townsville-Cloncurry rly., is 78 m. S. of Townsville, and the centre of one of the smaller goldfields, dating from 1870.

Ravensworth. Village of Durham, 3 m. S. of Newcastle-on-Tyne. Here is Ravensworth Castle, the seat of Baron Ravensworth. It was built early in the 19th century on the site occupied by an earlier castle.

Ravi. River of the Punjab, forming in part of its course the boundary between W. Punjab (Pakistan) and Punjab (India). About 450 m. long, it rises near the Rotang Pass in Kangra and flows N.W. through the Indian state of Chamba, then S.W. to join the Chenab about 35 m. N. of Multan. At Lahore the Ravi is spanned by road and rly. bridges. It provides much of the water for the Upper Bari Doab canal. On the right bank opposite Lahore are the tombs of the emperor Jehangir and Noor-jahan, his wife.

Ravilious, ERIC (1903-1942). British artist. Educated at Eastbourne grammar school, he studied art at the Royal College of Art, where he taught during 1929-38. A fine wood engraver, he illustrated editions for the Nonesuch and Golden Cockerel presses, and made a reputation with printed designs for pottery and engraved ones on glass. In 1937 he designed pottery for Wedgwood, beginning with a Coronation mug. With Edward Bawden he executed murals at Morley College, London. During the

Second Great War Ravilious was an official Admiralty war artist, but was reported missing in 1942, while flying from Iceland.

Rawalpindi. Division and dist. of W. Punjab, Pakistan. The division lies in the N.W. of the province; it is sparsely populated, mainly by Mahomedans. Wheat is the chief crop. The dist. lies W. of Kashmir and W. and N. of the Jhelum. Most of it is a high plateau, much dissected by ravines. Forest covers a large area. Wheat, pulses, and millet are grown. Area, div., 21,381 sq. m.; dist., 2,022 sq. m. Pop., div., 4,700,958; dist., 785,231.

Rawalpindi. Town of Pakistan, in the W. Punjab. It is situated 155 m. N.W. of Lahore, on a tributary of the Sohan, has strategic roads and rlys., and is the most important military cantonment in the N. of the Indian sub-continent. It has rly. workshops, a brewery, and an arsenal. There is extensive trade with Kashmir. In 1849 the Sikhs surrendered here upon their defeat at Gujarat by Gough. Pop. 181,169.

Rawalpindi. A British armed merchant cruiser. The first important naval engagement of the Second Great War was fought on Nov. 23, 1939, between the Rawalpindi, a former P. and O. liner of 16,697 tons, and the German battle-cruiser Scharnhorst (*q.v.*). The Rawalpindi was engaged in contraband control when she sighted the German S.E. of Iceland. An attempt was made to escape under cover of a smoke screen, but a second German vessel was seen to starboard. The Scharnhorst opened fire and presently the second German ship came into action. The Rawalpindi fought gallantly until all her guns had been silenced and nearly the whole ship was ablaze, when she went down with flag flying. More than 260 officers and men were reported missing. For some time it was erroneously thought that the German pocket battleship Deutschland was engaged in the fight.

Rawdon. Part of Aireborough urban dist., Yorks. (W.R.), England. It is 5 m. N.W. of Bradford, with a rly. station. The chief industry is the manufacture of cloth. A Baptist theological college was opened in 1859. The marquess of Hastings took from here the title of the earl of Rawdon, his ancestors having lived at Rawdon Hall, Hedley Verity, England cricketer, was born here. Pop. 4,754.

Rawlings, MARGARET (b. 1906). British actress. She was born

June 5, 1906, at Osaka, Japan. In Oxford she went to the high school and Lady Margaret Hall; and in 1927 went on the stage, playing the lead in *The Doctor's Dilemma*, at Croydon. She married in 1942 (Sir) Robert Barlow. This actress needed an impassioned part or poetic language to do justice to her

Margaret Rawlings, British actress

rich voice and striking personality. She came to the front in 1936 as Kitty O'Shea in *Parnell*, and made successes in *Black Lighthouse*, *The Flashing Stream*, and as Mrs. Dearth in *Dear Brutus*. After six years' absence from the stage—though not from reading poetry—she reappeared in 1947 in *The White Devil*.

Rawlinson, HENRY SEYMOUR RAWLINSON, 1ST BARON (1864-1925). British soldier. Born Feb. 20, 1864, he was the eldest son of Sir Henry Rawlinson (*q.v.*), to whose baronetcy he succeeded in 1895. From Eton he went to Sandhurst, joining the 60th Rifles in 1884 and saw service in India as A.D.C. to Roberts, and in Burma 1886-87. In 1888 he joined Kitchener's staff in Egypt, and in the S. African War served on the staff. He was commandant of the Staff College, 1903-06. and was given command of a brigade, 1907, and a division, 1910. At the outset of the First Great War he was made director of recruiting, but in Sept., 1914, commanded the 7th division, which he led through Belgium to Ypres. At the end of 1915 he was given command of the new 4th army, and was responsible for the main Somme attack of July, 1916.

Early in 1918 he was appointed to the Versailles council, but after the 5th army disaster at St. Quentin in March he returned to the front to command the reorganized 4th army in the final offensives. In 1919 he was created a baron and awarded £30,000. He was c.-in.-c. in India, 1920-25, and died Mar. 28, 1925, when the barony became extinct.

Rawlinson, GEORGE (1812-1902). British scholar. Born at Chadlington, Oxon, Nov. 23, 1812,

he was educated at Trinity college, Oxford. He became a fellow and lecturer of Exeter college, was ordained, and in 1861

was made Camden professor of ancient history. In 1872 he was chosen canon residentiary of Canterbury, and he was rector of All Hallows, Lombard St., London, from 1888 until his death, Oct. 7, 1902.

Rawlinson is chiefly remembered by his great edition of Herodotus, with translation and annotations by himself, and special archaeological and historical dissertations by his brother, Sir Henry Rawlinson (*v.i.*), and Sir J. G. Wilkinson. The translation has been reprinted in *Everyman's Library*. Rawlinson also wrote on Assyria, Chaldea, Babylonia, Media, Persia, Parthia, and ancient Egypt.

Rawlinson, SIR HENRY CRESWICK (1810-95). British Orientalist and diplomatist. He was

Sir H. Rawlinson, British Orientalist

born at Chadlington, Oxon, April 11, 1810, and entered the service of the East India Company in 1827. Six years later he undertook the reorganization of the Persian troops, and devoted his leisure to the study of cuneiform inscriptions. In 1840 he became political agent at Kandahar, and four years later was made consul at Bagdad, where he collaborated with Layard in excavations at Nineveh. Rawlinson's collection of antiquities is now in the British Museum. In 1859 he was appointed minister plenipotentiary to Persia, but retired a year later. He was M.P. for Reigate, 1858, and Frome, 1865-68. He was the author of a *History of Assyria*, and joint editor with his brother (*v.s.*) of Herodotus. He was made K.C.B. on his return from India, and a baronet, 1891. He died March 5, 1895.

Rawnsley, HARDWICKE DRUMMOND (1851-1920). British divine. Born at Shiplake, near Henley, Sept. 28, 1851, the son of a clergyman, he was educated at Uppingham and Balliol college, Oxford. Having been ordained in 1875, he was appointed vicar of Wray, Windermere, in 1878, and of

George Rawlinson, British scholar Elliott & Fry

Lord Rawlinson, British soldier Russell

Crosthwaite, Keswick, in 1883, resigning in 1917. He died May 28, 1920. Rawnsley was known for his efforts to preserve the beauties and associations of the Lake District. He wrote several volumes on the district, some verse, and other books, including *Memories of the Tennysons*, 1900. He was hon. sec. of the National Trust (*q.v.*).

Rawsthorne, ALAN (b. 1905). British composer. Born May 2, 1905, at Haslingden, Lancs, he

Alan Rawsthorne,
British composer

went to school at Southport and was trained at the R.C.M., Manchester. During 1932-34 he was engaged as a musician at Dartington Hall (*q.v.*). In writing for full

orchestra he favoured the form of free symphonic variations, and produced variations for two violins, 1938; symphonic studies, 1939; concerto for piano, 1942, and for violin, 1948; as well as songs and piano pieces.

Rawtenstall. Mun. borough of Lancashire, England. It is 19 m. N. of Manchester, and has four rly. stations. Cottons and woollens, felts and slippers are manufactured, and there are coal mines in the neighbourhood. Owing its growth to the industrial development of the 19th century, Rawtenstall was made a borough in 1891. Pop. 28,587.

Rawtenstall arms

Ray. In physics, line along which light or other radiation is transmitted. It is a line drawn at right angles to the wave-front of an electro-magnetic wave. Radiation of all kinds is sometimes loosely described by the term "rays." Such rays extend from the so-called gamma-rays (wavelength 10^{-9} – 10^{-10} cm.), met with in connexion with the disruption of atomic nuclei, through X-rays (10^{-6} – 10^{-9} cm.), the ultra-violet rays (10^{-5} cm.), the visible spectrum (7×10^{-5} – 4×10^{-5}), and the infra-red (10^{-2} – 10^{-3}), to the long waves known in radio ($10^2 \times 10^5$ cm.). All these rays are identical in structure and speed of propagation, their only difference being in wavelength. See Cosmic Rays; Gamma Rays; Infra-red Radiation; Light; Radio-therapy; Ultra-violet Radiation; X-Rays.

Ray. Name given to many fishes of the elasmobranch order, which includes the sharks, skates, and other forms. In the rays the skeleton is cartilaginous, the body is flattened, and the pectoral fins greatly expanded. See Skate.

Ray, EDWARD (1877-1943). British golfer, born March 28, 1877. He played for England against Scotland in 1906-07-09-10; won the British open championship in 1912 and that of the U.S.A. in 1920; and was captain of the first team to contest the Ryder Cup in 1927. Spoken of at one time in the same breath with James Braid and Harry Vardon, Ted Ray was a pioneer of shots now universally played. See Golf.

Ray or WRAY, JOHN (1627-1705). English naturalist. Born at Black Notley, Essex, Nov. 29, 1627, he was a blacksmith's son. He was educated at Braintree and Cambridge, became fellow and lecturer of Trinity, and was ordained, but in 1662, owing to the Act of Uniformity, resigned his offices and travelled. He wrote accounts of journeys both in Great Britain and abroad, and with his friend, Francis Willughby, made extensive collections of flowers and plants. He died at Black Notley, Jan. 17, 1705. The results of Ray's investigations were published in a number of volumes. The Ray Society was founded in 1844.

Rayah (Arab. *ra'iyah*, peasants, subjects, from *ra'a*, to pasture). Term applied in Mahomedan countries to the unbelieving subjects of a Mahomedan sovereign, who are generally obliged to pay a special tax. In Turkey the rayah are divided into five classes or millets according to their religion, viz. Greeks, Armenians, Armenian Catholics, Latins or Roman Catholics, and Jews. See Ryot.

Rayburn, SAM (b. 1882). American politician. Born in Roanne co., Tenn., Jan. 6, 1882, he went to school in Texas and studied law at its university; he became a well-known lawyer and entered politics as a Democrat. In the Texas house of representatives during 1907-12, he was speaker for the last two years. He sat in congress continuously from 1913, was majority leader from Sept., 1940; minority leader 1947-49; then again majority leader.

Rayleigh. Dormitory town of Essex, England. Between the rivers Thames and Crouch, approximately 8 m. from the sea, it is part of the urban dist. of Southend, and within easy reach of London on the main rly. from Liverpool Street.

The arterial road from London to Southend runs through it. It is mentioned in Domesday Book, and has a moated mound which marks the site of Sweyn's Castle. Pop. 9,000.

Rayleigh, JOHN WILLIAM STRUTT, 3RD BARON (1842-1919). British physicist. Born at Lang-

3rd Baron
Rayleigh,
British physicist

ford Green, Essex, Nov. 12, 1842, he was a grandson of Joseph Holden Strutt, M.P., an Essex landowner, for whose wife the barony was created in 1821. He was educated at Trinity college, Cambridge, being senior wrangler and first Smith's prizeman. He succeeded to the title in 1873. Appointed to the chair of experimental physics at Cambridge and director of the Cambridge laboratory in 1879, he went in 1884 to be president of the British Association at Montreal. He was professor of natural philosophy at the Royal Institution from 1887 till 1905, when he became president of the Royal Society. In 1908 he was appointed chancellor of Cambridge. He died June 30, 1919.

On resigning his chair at Cambridge in 1884, Rayleigh devoted ten years to a study of the atomic weights of gases. His researches resulted in the remarkable discovery that the atmosphere contained several gases till then unknown. At the meeting of the British Association in 1894, he announced the isolation by Sir William Ramsay of one of these, argon, to which afterwards were added neon, krypton, and xenon. In other branches Rayleigh left the enduring mark of his genius, in pure mathematics, hydrodynamics, aeronautics, electricity, etc., and four volumes of his collected scientific papers were published, 1899-1903. A man of wide interests, Rayleigh made a study of spiritualistic phenomena.

He was appointed to the Order of Merit, 1902, awarded the Royal medal, 1882, and Copley medal, 1899, of the Royal Society, and in 1904 the Nobel prize for physics. A mural tablet to his memory was unveiled in Westminster Abbey, 1921. See Argon; Ramsay, Sir William.

Rayleigh, ROBERT JOHN STRUTT, 4TH BARON (1875-1947). British physicist. Born Aug. 28, 1875,

his mother being a sister of A. J. Balfour, and educated at Eton and Trinity college, Cambridge, he

4th Baron Rayleigh,
British physicist

early showed much of the brilliance of his father, the 3rd baron, to whose title he succeeded in 1919. He became F.R.S. in 1905, and did much scientific research, mainly on radium. He was president of the Royal Institution and Emeritus professor of physics at the Imperial college of science. He wrote a life of his father, 1924, and of J. J. Thomson, 1942. He died Dec. 13, 1947, and was succeeded in the barony by his son, John Arthur Strutt (born April 12, 1908).

Raymond, ERNEST (b. 1888). British novelist. Born Dec. 31, 1888, and educated at S. Paul's school and Durham university, he became a schoolmaster in 1908, and in 1914 took holy orders, serving as chaplain in the First Great War. He resigned his orders in 1923. Experiences on the eastern and western fronts provided the basis of some of his many novels. His main successes in fiction were: *Tell England*, 1922; *Daphne Bruno*, 1925; *A Family that Was*, 1929; *The Jestling Army*, 1930; *We the Accused*, 1935; *The Last to Rest*, 1941. An enthusiastic essay was *Through Literature to Life*, 1928. *For Them That Trespass* appeared in 1944.

Raynaud's Disease. Localised intermittent contraction of the blood-vessels in the extremities, causing the fingers or toes to become cold and white, or "dead." It is named after the man who first described it. Attacks may be brought on by exposure to cold or emotional disturbance, and the condition is usually found in nervously unbalanced women. The spasm, which may be associated with severe pain, usually passes off in an hour or two. After repeated and severe attacks, gangrene of the fingers and toes may occur. Frequently the same digits on either side of the body are affected; hence the alternative name, "symmetrical gangrene." Exposure to cold must be avoided, and all efforts made to strengthen the circulation of the blood.

Raynes Park. A district of Greater London. It lies S. of Wimbledon, between Merton Park and New Malden, in the co. of Surrey, and has a rly. station 8½ m. from

Waterloo. The district is largely residential, though there are many light industries.

Raynouard, FRANÇOIS JUSTE MARIE (1761-1836). French author and philologist. Born at Brignoles, Provence, Sept. 8, 1761, he was educated as a lawyer, and became an advocate. He was confined to prison during the Revolution, owing to his Girondist sympathies, and while there wrote a tragedy, *Caton*. His single dramatic success was with *Les Templiers*, at the Comédie Française, 1805. Two years later he was elected a member of the French Academy, and in 1817 was appointed its secretary. In 1818 he began the publication of his *Choix de Poésies Originales des Troubadours*; the sixth and last volume was issued in 1821. His great *Lexique Roman*, a word-book of the medieval Provençal language, was posthumously published in 6 vols., 1838-44. He died at Passy, Oct. 27, 1836. *Consult* *Origin of Romance Languages*, Sir G. C. Lewis, 1839.

Rayon. According to the British Rayon Federation and the Textile Institute, the generic term applied to all fibres for textile use which are not of natural occurrence. Originally there were four main types, based on (a) cellulose nitrate, (b) viscose, (c) cuprammonium cellulose, and (d) cellulose acetate. Of these only the cellulose acetate appeared in the finished fibre form as the ester, all the others being reconverted to cellulose in the course of manufacture. The so-called "nitro" or "Chardonnet" rayon has been eliminated, and to the list has been added a number of man-made fibres based on casein, vinyl polymers and co-polymers, and polyamides. The last are commercially known as nylon (*q.v.*). According to a report published March, 1948, the Tennessee Eastman Corp. of America discontinued the use of the word rayon as a generic term for its cellulose acetate textile fibres: this was the first direct challenge to the Federal Trade Commission ruling which had held since 1937.

In 1910 world production of rayon was about 8,000 tons; in 1941 it reached 1.2 million tons, about 15 p.c. of the total production of all textiles.

Viscose rayon. This is prepared by steeping high grade (spruce) wood-pulp in 18 p.c. caustic soda for 30-90 mins. at 18° C., liquid then being expressed to three times the dry pulp weight. The alkali cellulose is then shredded and ripened at 25°-30° C. for 48 hrs., after which it is treated with carbon bisulphide (2 : 1) at 20°-30° C. This yellow xanthate is finally mixed with 4-6 p.c. aqueous caustic soda to give the orange-yellow solution, which is filtered and forced through suitable platinum alloy spinnerets into an acid precipitating bath at 40° C. The crude fibres thus produced are washed and then treated with hot alkaline solutions (sodium sulphide) to remove the combined sulphur, and "regenerate" the cellulose. The final viscose fibre is thus often referred to as a "regenerated" cellulose fibre.

Viscose rayons are available as bright (unpigmented) or dull (pigmented with titanium oxide), and also as special high-tenacity yarns for tire cords. Normal viscose has a dry tensile strength of 1.6-2.0 grams per denier with an elongation of 15-20 p.c. Loss of tenacity dry to wet may be as much as 60 p.c.

Cuprammonium Rayon. In the manufacture of this form, cotton linters are added to a mixture of ammonia and copper hydroxide with constant stirring, attaining a solution concentration of 15-20 p.c. in one hour without gelation, this being subsequently reduced to 4 p.c. by the addition of water. This solution is filtered, and after the necessary storage, is extruded through spinnerets into a 4 p.c. sodium hydroxide solution at room temperature. The fibres are then stretched before winding, washed, and treated with 1-3 p.c. sulphuric acid to eliminate the non-cellulosic constituents (ammonia and copper), which are recovered. One authority gives 0.57 lb. of ammonia (26° Beaumé), 0.80 lb. 50 p.c. caustic soda, 0.75 lb. copper sulphate, 0.92 lb. cotton linters as essential for the production of 1 lb. cuprammonium rayon. Like viscose, this is also a regenerated cellulose fibre, characterised by its remarkable fineness. Bright and dull fibres are produced. Dry tenacity varies from 1.43 grams per denier (bright) to 1.62 grams per denier (dull), with an elongation of 14 p.c. Wet strength shows a loss varying from 30-50 p.c., with a 10 p.c. increase in elongation.

Cellulose Acetate Rayon. Secondary or acetone-soluble cellulose

F. J. M. Raynouard,
French author

acetate used for the manufacture of rayon is prepared by treating 1 part bleached cotton linters at controlled temperature (0° – 25° C.), with a mixture of 3 parts glacial acetic acid, 2 parts acetic anhydride, and 0.1 part concentrated sulphuric acid, with constant mixing, until the cellulose passes into solution to yield a light yellow syrup. Residual anhydride is then "killed" by the addition of the theoretical amount of water, the temperature rise being controlled according to the solution viscosity required. The syrupy mass is then allowed to "ripen" at 20° – 21° C. for 60 to 70 hrs., or until the required degree of acetone solubility is attained. The cellulose acetate is then precipitated as a flake-like mass by the controlled addition of water, after which it is washed acid free and dried under moderately heated air blast. For the manufacture of fibres the cellulose acetate should be perfectly soluble in acetone, and should have a combined acetic acid content of 54–54.5.

The spinning solution is prepared by dissolving the "flake," usually finely ground and uniformly blended, in pure acetone to give a solution of 20–25 p.c. concentration according to the viscosity of the acetate. This solution is carefully filtered to remove all mechanical impurities, and is then forced through multi-hole spinnerets, downwards, into a heated "metier" case. The filaments thus produced are first oil-lubricated and next given a controlled "twist," and are wound direct on to bobbins. The cellulose acetate fibres are used as produced, as an ester of cellulose.

Occasionally the acetate yarn receives an after-treatment in the nature of a surface saponification for the production of "strong" and "dull" yarns. More usually the latter is attained by the addition of a small quantity of a white pigment to the spinning solution.

The dyeing properties of cellulose acetate rayon differ markedly from those of viscose and cuprammonium: the latter, being pure cellulose, dye satisfactorily with cotton dyestuffs. The commercial development of "acetate" rayon was held up for many years through this difficulty of dyeing, but this is no longer a problem, special dyestuffs having been developed to meet the need. Acetate rayon is more water resistant than the cellulose fibres, and its loss of strength wet/dry is of the order of 12 to 18 p.c.

Cellulose acetate fibres are widely used as warps in the weaving of mixed fabrics with viscose, cotton, etc. This makes possible the production of "effect" fabrics making use of the difference in dyeing properties between the "acetate" and true cellulose fibres.

Rayonné. In heraldry, any charge decorated with rays. The rays are usually of gold, silver, or red, and representing light or flames. The term is also applied to a line of demarcation, composed of a series of rays with wavy outline.

Rayonné in heraldry

Ray Therapy. Treatment of disease by the violet and ultra-violet rays of the spectrum, particularly by the means of what is popularly known as artificial sunlight. It is to the ultra-violet, or actinic, rays that the pigmentation of the skin is due, as well as certain chemical and physical changes in the blood. Direct sunlight gives all these, but also the depressing invisible rays above the ultra-violet. With artificial sunlight it is possible to administer a duly regulated dose of light composed of the desired wave-lengths.

The apparatus consists fundamentally of an arc, formed in open air by an electric current passing between two electrodes, or in mercury vapour enclosed in a quartz tube. The electrodes may be of carbon, tungsten, or iron, or a mixture of these and other elements. The Finsen Light (*q.v.*), used for the treatment of lupus, was the earliest form of ray-therapy apparatus; it was a carbon arc lamp. Mercury arc lamps are air-cooled (for focal or cavity work) or water-cooled (for both external and internal treatment).

The range of ray therapy is still largely undefined. In the treatment of rickets in young children excellent results have been obtained. The rays convert a substance in the skin (cholesterol) into vitamin D, to the absence of which rickets is partly due. Children receiving daily irradiation are found to grow at an increased rate, and the treatment appears to raise their powers of resistance against infection. Many patients experience an increased sense of well-being, a greater vigour, and a diminished susceptibility to in-

fection by catarrh organisms. But there is difference of opinion as to the effect of irradiation on the blood.

Local applications of the rays to localised lesions have proved useful, the healing of refractory wounds have been speeded, and various skin diseases have improved considerably. Satisfactory results have sometimes been achieved in the treatment of glandular tuberculosis. *See also* Radium; X-Rays.

Razor (Fr. *rasoir*, from Lat. *radere*, to scrape). Keen-edged cutting blade for shaving. The custom of removing hair from the face, either altogether or from certain parts, is one that goes far back in the history of the human race. For this purpose the razor was made, of various materials before the Bronze or Iron ages, a sufficiently sharp edge being ground on flints, shells, or bones.

Early steel razors were first made by swordmakers, and the principle has little altered to the present day. The ordinary open razor comes from a strip of steel forged into a long, narrow wedge with straight sides tapering to a sharp edge. The blade is then shaped on an anvil and its edge ground and sharpened. After the blade has been dry-ground to remove all traces of oxide, it is

Razor. 1. Primitive pattern, bronze. 2. Bronze razor of very early date found in Athens. 3. Early Phoenician, with engraved bronze blade

hardened by heating to a bright red and then plunged in cold water; it is then tempered by further heating and cooling. The edge is next wet-ground on a succession of revolving stones. After polishing with emery powder paste on a wheel covered with a tin-lead alloy, the blade is jointed into a bone, ivory, or celluloid haft. The finished blade is often elaborately etched.

In 1815 the practice was introduced of hollowing out the sides of the razor blade by successive grindings to improve the fineness

of the cutting edge and facilitate resharpening. With the use of grinding wheels of successively diminishing diameters, the modern full hollow-ground razor blade is actually thinner in its centre than near the cutting edge, and can be made to give a resonant ring.

Numerous attempts were made to evolve a razor which would obviate the danger of the user cutting himself, but none proved satisfactory until the introduction of the Gillette early in the 20th century. The principle of this type, as of all safety razors, is to place between the skin and the cutting edge a guard which permits the blade to pass over uneven surfaces of the features without cutting the skin as it removes the hair. Safety razor blades are automatically produced from long strips of thin steel fed into machines. The machines grind and sharpen the strips, punch holes to fit the blade holder, cut the strips into individual blades, and finally grease and wrap each blade separately. Some safety razor blades have a cutting edge on each length; others, thicker, have a single cutting edge, and can be repeatedly stropped. Sheffield, England, has long held supremacy in making ordinary and safety razors.

Dry shavers, i.e. safety razors used without application of lather, are generally electrically operated. Cutters actuated by a small electric motor are fitted into a case that also contains the motor. When the end of the case is placed against the skin, the hairs are cut off by the moving cutters—or in some kinds by a rotating blade. A non-electric dry shaver has a hand-operated prime mover; in another type the blade moves back and forwards across the hairs with a rocking motion imparted by the user. See Beard; Steel.

Razorbill (*Alca torda*). British sea bird of the auk family. It is 17 ins. long in body, and the plumage

Razorbill. British sea bird allied to the extinct Great Auk

is greenish black on the upper parts, brown on the throat, and white below. The beak is very massive, and is flattened laterally; and the bird generally much resembles the extinct great auk, of which it is the nearest living relation. It occurs sparsely around the British coasts. It spends nearly all its time on the water, resorting to the cliffs in the breeding season.

Razor Shell or **RAZOR FISH**. Popular name for the solen, a common bivalve mollusc of which

Razor Shell. The common bivalve, *Solen siliqua*

about five species occur around the British coasts. The shell is long and very narrow. Solens are to be found between tide marks on every sandy beach. They burrow deeply and rapidly into the wet sand.

R.D.X. Abbrev. for the most powerful and widely used of new explosives developed during the Second Great War. R.D. stands for research department. Other names for it are cyclotrimethylene-trinitramine, cyclonite, hexogen, and T4. See Cyclonite; Explosives.

Re. In music: (1) The second of the Guidonian syllables. In Tonic Sol-fa it is the second degree of the major scale, and is pronounced ray. (2) The name of D in France and Italy.

Ré. Island of France. It lies in the Atlantic Ocean, 9½ m. W. of La Rochelle, and is divided into two districts, of which the chief towns are Saint-Martin and Ars. A British expedition under the duke of Buckingham landed here in 1627 in an unsuccessful attempt to relieve La Rochelle. A light rly. runs from Sablanceaux to Les Portes (22 m.) at the N.W. of the island. It is protected from the sea by sea-walls and dunes, and defended by four forts. There are considerable salt marshes and vineyards. It is about 16 m. long and 3 m. broad.

Rea, ALEC LIONEL (b. 1878). British theatrical manager. Born at Liverpool, Jan. 30, 1878, he was educated at London university, and became director of a banking firm. In 1911 he was a director of the Liverpool repertory theatre (Playhouse). Chairman and founder with Basil Dean of the theatrical organization Reandean, and Reandco, the company which succeeded it, and which presented many well-known plays, he was

lessee of the Apollo Theatre, London, from 1937. Rea was deputy director of Ensa, 1939-45, and treasurer of the British Drama League, 1925-45.

Read, HERBERT (b. 1893). British critic and poet. Born Dec. 4, 1893, he was educated at Crossley's school, Halifax, and the university of Leeds. After service in the First Great War, he became assistant principal in the Treasury, a post he held from 1919 to 1922. He was then appointed assistant keeper, Victoria and Albert Museum, continuing until 1931. From 1933 to 1939 he edited the Burlington Magazine. As a critic, Read

was influenced by abstract painting and interpreted the aims of this art form in terms of an intellectual anarchism. His publications included English Prose Style, 1928; The Meaning of Art, 1931; Art and Industry, 1934; Art and Society, 1936; Poetry and Anarchism, 1938; Education Through Art, 1943. His poetry, collected in 1934, was for the most part of the abstract, intellectual kind, taking a secondary place to his art criticism. A study of his work, ed. H. Treece, came out in 1944.

Reade, CHARLES (1814-84). British novelist and dramatist.

He was born June 8, 1814, and educated at Magdalen college, Oxford. He became a barrister, but soon turned to literature. He began with plays, of which the first was produced on the stage in 1851. The best known of them, perhaps, are The Lost Husband, Masks and Faces, 1852 (written in collaboration with Tom Taylor), The Lyons Mail, The Double Marriage, originally a novel, and Drink, 1879, adapted from Zola's L'Assommoir. His reputation was made, however, with his novels, especially The Cloister and The Hearth, 1861, which depicts in realistic manner the life of the 15th century, and is generally regarded as one of the masterpieces of historical fiction. Of the others may be mentioned Peg Woffington, 1852; Christie Johnstone, 1853; It is Never too Late to Mend, 1856, a sensational story of prison life in the early days of Australian colonisation; Hard Cash, 1863, an ex-

Charles Reade, British novelist and dramatist

posure of the abuses of the private asylum; Put Yourself in His Place, 1870; and The Wandering Heir, 1875. The Perilous Secret was published after Reade's death, which took place in London, April 11, 1884. He dramatised several of his novels and wrote short stories and a book on the violin. *Consult* Charles Reade, M. Elwin, 1931.

Reade, WILLIAM WINWOOD (1838-75). A British writer. A nephew of Charles Reade, he was born Dec. 26, 1838, and educated at Hyde House school, Winchester, and Magdalen college, Oxford. He travelled in Africa and did valuable original work in geography, reaching the Niger from the Gold Coast in 1869. In 1873, on the outbreak of the Ashanti War, he returned to Africa as special correspondent of The Times. His health was undermined by this trip, and he died April 24, 1875.

Winwood Reade wrote travel books and novels, but his fame is due to The Martyrdom of Man, 1872. This book, still widely read, was one of the earliest attempts at writing a universal history, and, while imbued with a somewhat gloomy outlook, has been a fertile source of ideas for later writers, being named by H. G. Wells as one of the works which inspired The Outline of History.

Reader. In universities, term applied to certain classes of teachers or lecturers. Sometimes readers assist the professors in their duties, and others teach subjects for which there is no professorial chair in existence. In the Inns of Court, the reader was originally one who lectured on legal questions to his inn; readings on statutes, etc., are extant from the time of Edward I, and are of importance in legal history. The office still survives. *See* Inns of Court.

Reader. One who corrects proofs taken from type before the type is passed for the press. He is also known as a proof-reader, and the London society founded to promote his interests is called the Association of Correctors of the Press. A readers' pension committee was formed in London in 1888 to raise funds for the Printers' Pension Corporation and to assist readers or their widows to election to pensions. Since its foundation it has raised £25,000, founded 51 pensions, and assisted 250 readers or their widows to election to pensions.

The term reader is also used of one who reads MSS. on behalf of a publisher, reporting on their merits. Meredith, Lord Morley,

Edward Garnett, and other eminent men of letters have acted as publishers' readers, sometimes being of very great importance in encouraging promising writers in their early days.

Reading. The act of perusing and interpreting written characters; more generally, noting and understanding marks of all kinds made on surfaces to convey ideas; e.g. engineering drawings, mathematical arguments (which at times employ a highly complex notation), picture writing or hieroglyphics, shorthand, chemical structures, electrical circuits, musical scores can all be read. Most of us have only a limited ability to read, many being able to interpret only written words and figures of their own language.

Steps towards learning to read are generally taken before the infant school stage. Much thought has been given by educationists to this process. At first the work of teaching to read was based on the alphabet and the building up of words from single letters and their sounds and the simplest syllables. But any phonetic plan must soon be abandoned in a language such as English; and the tendency has been to rely more and more on the "look and say" method. The child is taught to associate a whole printed word or phrase or even a whole sentence with a picture. Only when some progress has been made towards reading consecutive sentences and even simple stories is much attention directed to the analysis of individual words. In the attempt to expedite the reading of foreign languages, shorthand, etc., counts have been made to ascertain the most frequently recurring words, and textbooks based on these words have been prepared. Reading need not be accompanied by knowledge of what is read, and there seems to be no constant relationship between speed of reading and comprehension of the subject. *See* Alphabet; Phonetics; Writing; *consult* Psychology and Pedagogy of Reading, E. R. Huey, 1908; Books: An Introduction to Reading, W. W. Miller, 1932.

Reading. In British parliamentary procedure, term denoting successive stages in the passage or rejection of a bill. The first reading is a formal business without debate, but provides the opposition with the opportunity of rejecting the bill by moving that it be read a second time this day six months. The second reading with debate on broad lines is taken after the bill

has been printed and circulated to members. After the committee and report stages, the bill as amended comes up for the third and final reading, which is only formal. Divisions may be taken at all stages. *See* Parliament.

Reading. Co. bor. and the county town of Berkshire, England. It stands on the Thames, at the junction of that river with the Kennet, 36 m. W. by S. of London, and is served by rlys., being a junction, and by the Kennet and Avon Canal. Of the churches, the chief are those

Reading arms

of S. Lawrence, S. Mary, S. Giles, and the restored chapel of the Grey Friars, at one time used as the town hall. Other buildings include the municipal offices, connected with which is a museum famous for its collection of relics from Silchester (*q.v.*), and the county hospital. A university college opened here in 1892 was raised in 1926 to the status of a university; in addition to the main buildings it possesses two halls. There is a grammar school dating from 1486. In the prison Oscar Wilde wrote De Profundis and The Ballad of Reading Gaol. Some ruins remain of a Benedictine abbey founded by Henry I in 1121 and his place of burial; the grounds are public property. Palmer Park and Prospect Park are other recreation grounds. On the other side of the Thames is Caversham, while Earley and Tilehurst are other suburbs.

Reading is an important agricultural centre, being especially noted for its seeds. It has printing and engineering works and biscuit factories. The council maintains a service of buses and trolley buses. Reading became a corporate town in the 13th century, and was later a centre of the wool trade. Henry VIII made the abbey into a palace. From 1295 to 1885, and from 1950, Reading sent two members to the house of commons; between 1885 and 1950 it had one. Archbishop Laud was born here. Market days, Mon. and Sat. Population estimated 112,830.

Reading. Fifth city of Pennsylvania, U.S.A., the co. seat of Berks co. It stands on the Schuylkill river, 59 m. N.W. of Philadelphia, and is served by rlys. and the Schuylkill Canal. Reading lies in an important coal and iron mining region, and trades in agricultural produce. It contains rly. workshops, iron and steel works, ma-

chine shops, woollen and worsted mills, and hosiery, hardware, and boot and shoe factories. It is the leading centre for the production of fully fashioned hosiery. Founded 1748, Reading was incorporated 1783, and became a city 1847. Population 110,568.

Reading, RUFUS DANIEL ISAACS, 1ST MARQUESS OF (1860-1935). British lawyer and administrator. This son of a London fruit importer of Jewish stock was born Oct. 10, 1860, and called to the bar in 1887. Made Q.C. in 1898, he entered parliament as Liberal M.P. for Reading in 1904, and in 1910 was appointed solicitor-general and after a few months attorney-general. Asquith made him a member of the cabinet in 1912, the first attorney-general

so honoured. An advocate of immense reputation for clarity and skill in cross-examination, he was made lord chief justice and Baron

1st Marquess of Reading,
British lawyer
Russell

Reading in 1913. He assisted Lloyd George at the beginning of the First Great War in framing the financial measures which preserved British credit and secured the flotation of a large war loan. Success in negotiating an American loan led to his being appointed high commissioner and special ambassador to Washington in 1918. He was made viscount in 1916 and earl in 1918. Sent to India in 1921 as viceroy, he played a distinguished part: he established self-government everywhere except in Bengal and the Central Provinces, did much to still the anti-British feeling provoked by the Amritsar episode, tried to secure fair treatment for Indian immigrants to the Empire; but he had to arrest Gandhi for inciting to civil disobedience. When Reading retired in 1926 he was raised to a marquessate. He held

the foreign secretaryship for a few months in 1931, and died Dec. 30, 1935, when his son Gerald (b. Jan. 10, 1889) succeeded to the peerage. The latter's heir is Viscount Erleigh. The 2nd marquess wrote his father's life in 2 vols., 1943 and 1945. See India.

Reading, STELLA, DOWAGER MARCHIONESS OF. British organizer. Daughter of Charles

Dowager Marchioness of Reading,
British organizer

Charnaud, she was on the staff of the 1st marquess of Reading during his vicereignty in India, 1921-26; she married him as his second wife in 1931. She was founder and chairman of the W.V.S. from 1938. A governor of the B.B.C. in 1946, she became vice-chairman the following year.

Reading Beds. In geology, a group of sandy clays, clays, sands, and, locally, gravels of fluvial origin occurring below the London clay. When followed E. they show estuarine characteristics and are referred to as the Woolwich Beds. W. of London the Reading

Reading, Berkshire. 1. The Town Hall. 2. The Assize Court. 3. Scene on the river Thames where bathing and boating are enjoyed. 4. The College Hall and Cloisters of the University

Beds rest directly on the chalk, and E. they overlie the Thanet Sands. The clays are used for brick and tile making.

Reagent. A substance which acts in a chemical transformation. It is more particularly used of substances found valuable in qualitative analysis, and used as specific tests, e.g. sulphuretted hydrogen, which produces precipitates of various colours, the colour enabling the presence of certain metals to be confirmed.

Real (Sp., royal). Obsolete Spanish and Portuguese coin still current in Brazil. In Spain up to 1868 the real was the tenth part of an escudo (*q.v.*) and of nominal value 2½d. In Portugal, from 1854 till 1911, the gold milreis or 1,000 reis was the standard. Fifty and 100 reis nickel coins were also minted, and 20, 10, and 5 reis

Real. Obverse and reverse of the old Spanish coin. Actual size, $\frac{3}{16}$ in.

bronze coins. The Mexican real or Mexican shilling, once circulating in the U.S.A., had a nominal value of 12½ cents.

Realgar or **RUBY SULPHUR**. Red sulphide of arsenic, AsS. The realgar used in commerce is artificially prepared by subliming a mixture of arsenic and sulphur ores. Its chief use is in the tanning industry, where, mixed with lime, it removes hair from the skins. It is used for making Indian or Bengal fire in signal lights. Artists used native realgar as a pigment before it was superseded by lead chromate. It comes from Saxony and Switzerland.

Realism (L. Lat. *realis*, from *res*, thing). Philosophical term with two distinct meanings. As opposed to nominalism, it is the theory, held by certain of the schoolmen, that general ideas, the universals, had an existence independent of individuals and the individual mind. As opposed to idealism, it is the theory that external objects have an existence independent of any thought about them, and that our knowledge of them is immediate or intuitive. See Idealism; Nominalism.

Realism. In art and literature, the direct representation of any subject as it is, a treatment, literally, that excludes idealism or romanticism. But the true work of art, however realistic its treatment, must perforce contain some elements of idealism, or fail in its purpose. Realism made its entry into French painting with Courbet. In sculpture it expressed itself in widely different manners, through Carpeaux, Barye, and Rodin.

In literature, the term is particularly applied to the method of the school of writers of fiction who describe life with strict fidelity to actual fact, as opposed to the schools of romanticism or classicism. The realist tendency, often also called naturalism, is found scattered in all modern literatures, and at various periods, but became crystallised into a definite school, mainly under French influence, in the second part of the 19th century. The painstaking dissection of character is seen earlier in Stendhal or Balzac, but Flaubert moved forward and achieved a masterpiece in Madame Bovary. He was followed by the de Goncourts, Huysmans, de Maupassant, Zola, and many lesser figures. Heated controversy arose round the alleged tendency of the realists to emphasise the sordid and corrupt in life; but their influence on the

novel was far-reaching, although their lengthy and laborious elaboration of detail gradually gave place to a more eclectic form.

In English literature realism has been tempered by characteristic moderation. George Eliot, Meredith, George Moore, Hardy, Wells, Bennett, Galsworthy, Eden Phillpotts, H. E. Bates, and (in the U.S.A.) Sinclair Lewis and John Steinbeck, represent phases of its growth, and the influence is seen in the later stress on detailed psychological analysis in the novel, as in Joyce. Gorky, Chekhov, Strindberg, Sudermann, Couperus, Knud Hamsun, Pierre Hamp, are typical of their respective countries, and the corresponding tendencies in drama are seen in Ibsen, Hauptmann, Eugene O'Neill, and again Galsworthy. See Naturalism; Romanticism.

Reality (L. Lat. *realitas*, from *res*, thing). In philosophy, the state or quality of being real, the "thingishness" of anything. That is real which is true and existent, such existence being absolute and necessary, either external and altogether independent of thought, or internal and dependent upon thought, but not upon the exercise of thought about it. Reality means something, possesses significance, but is not the subject of thought. The term is sometimes opposed to actuality, which rather indicates the nature and degree of reality attaching to real objects. Various kinds of reality have been distinguished: empirical, belonging to all objects of experience; objective, given to things as objects of sense-perception; subjective, in reference to a fact which is the subject of consciousness. See Metaphysics; Philosophy.

Realpolitik (Ger., policy of reality). Term used during the last thirty years of the German empire to denote the political attitude inaugurated by Bismarck and pushed to extreme lengths by his successors. The adherents of *Realpolitik* maintained that the politician should look primarily to the material interests of his nation, disregarding abstract theories and humanitarian ideals. See Bismarck; Germany; Politics.

Real Presence. Term used in theology to denote the doctrine that the living Christ is actually present in the experience of the Church and the individual believer, especially in the Sacrament of the Eucharist. The term "real" distinguishes this belief from the theory that Christ is only "sym-

bolically" present in the sacrament. Different views are held as to what constitutes the Real Presence and how it is produced. One holds that it is corporeal and produced by transubstantiation (*q.v.*). Another that it is purely spiritual—an experience within the soul of the participant. Though in modern usage the term has almost always a sacramental connexion, in the N.T. it has a much wider significance. Both S. Paul and S. John lay the utmost stress upon the mystical union between the believer and the risen Lord. To be "in Christ" and for Christ to be "in us" is the prerogative of every Christian. Perhaps the fullest enunciation of the doctrine is found in the words of S. Paul, "I live, yet not I, but Christ liveth in me." See Eucharist; Incarnation.

Real Property. One of the two sections into which property is divided under English law. In early times actions at law were of two kinds, real and personal. A real action was where the plaintiff asked the court to award him the thing (Lat. *res*) sued for. A personal action, *e.g.* for debt, detinue, and trespass, was where the plaintiff simply asked for a sum of money, a debt or damages. The only *res* worth suing for in those days was some freehold, either land, or some freehold estate, in or arising out of land; and if a plaintiff were dispossessed of any of these, the court would reinstate him in them. There were no long leases in those days. Land was generally held for a freehold estate. Its few leasehold tenancies were usually mere yearly holdings; and therefore no real action would lie in respect of them. They were called chattel interests in land. In this way property in England came to be divided into real and personal; real being those kinds of property in respect of which a real action could be brought; while everything else was personal.

It thus came about that real property included land held for a freehold or copyhold estate. Certain rights arising out of land were also real—rights of fishery, rights of way, profits à prendre. The title deeds of real property were themselves real. So were advowsons, tithes, dignities, certain offices, *e.g.* the office of hereditary earl marshal of England. But a lease for years was not real, but personal property. The Law of Property Act, 1925, made extensive reforms. See Land Laws.

Ream. Measure of paper. It consists of 480 sheets, or 20 quires. The perfect, long, or printer's ream contains 516 sheets, the surplus to make up for waste; a news ream, for printing newspapers, is 500 sheets. The word is derived from the Arabic word *rizmah*, a bundle.

Reamer. Tool for making or enlarging holes. See Drill.

Reaping. Term loosely used for the harvesting of any grain crop. Originally, to reap meant to cut down crop with a sickle—a steel blade roughly semicircular. The sickle has been superseded by the scythe, and neither tool is used to any extent except on small or awkward areas where binders or combine harvesters cannot travel. Antiquarians give evidence of bronze reaping hooks in France c. 2000 B.C. A successful reaping machine did not work in Great Britain until in 1826 one was produced by the Rev. Patrick Bell which may be seen in the Science Museum, London. Although this was a forerunner of all reapers it did not attract much notice until the Great Exhibition of 1851 drew attention to similar machines from America.

The cutting mechanism of the reaper differs little from that of the mower. A knife, composed of triangular sections giving a serrated edge not unlike a saw, reciprocates between steel fingers and thus produces a scissor action as it is drawn through the crop. The drive for the reciprocating fingers is taken from the large ("bull") land wheel, which carries most of the machine. From the same source four sails are driven to revolve in such a manner that they sweep the cut grain in more or less even quantities from a platform behind the cutter bar on to the ground.

Thus bundles are delivered for binding by hand into sheaves. The sheaves are stooked, i.e. pairs of sheaves are inclined towards each other so that they stand with only the cut ends on the ground, three or four pairs of sheaves constituting a stook. Most crops remain outdoors in stook for two or three weeks to mature before being carted to the stack where the small amount of sap left in them dries out. They are then fit to thresh.

Since 1900 the machine in greatest use has been the binder. Based on the original reaper, this is the outcome of Appleby's patent knoter (1869) whereby the sheaves are automatically tied with twine. To the cutting mechanism, driven

by the bull wheel, has been added a reel to gather the crop on the knife; the elevating system of endless canvases; and the binding and knotting mechanism. The binder for tractor draught is driven from the power take-off of the tractor instead of from the big wheel as in horse-drawn machines. The tractor travels at 4 to 5 m.p.h., compared with the horse's 2 to 2½ m.p.h.

To reduce the labour involved in binding, stooking, carting, stacking, thatching, and finally threshing, a cereal crop combine harvester has been developed. As the crop is cut it is elevated into a threshing drum, where the grain is extracted, the straw ejected. Grain may be passed into sacks or into a tank whence it is transferred into vehicles. More often than not such grain has to be dried artificially by hot air. A combine harvester is usually tractor-drawn, but some with their own engines of about 30 h.p. are self-propelled. Cost ranges from £300 to about £1,000. Seasonal output is based on 30 acres per ft. of cutting width. A 12 ft. combine harvester should harvest on the average 360 acres of grain during the season of 8 to 10 weeks. From under 500 in 1939 the number of combine harvesters in Great Britain rose to over 5,000 in 1948. An illus. showing a combine harvester is in page 179.

Rear-Admiral. Officer of the British navy, the lowest of flag rank. He is distinguished by the

Rear-Admiral's cap badge

broad gold band with one narrow gold band, and curl above it upon the cuff. Rear-admirals are the next in rank above commodores, 1st and 2nd class, and equivalent to major-generals in the army and to air vice-marshals in the R.A.F. See Admiral illus.

Rear-Gunner. Machine-gunner on a bombing aircraft who is responsible for defending it from rear attack. He is accommodated in a power-operated revolving turret fitted to the tail of the aircraft and armed with two to four machine-guns firing as a single weapon. In service slang he is "Tail-end Charlie."

Reason (Fr. *raison*; Lat. *ratio*). Mental faculty and process of drawing conclusions from premises. It embraces the collective ideas and

judgements which are common to all men and are distinguished by certain characteristics from the ideas and judgements which are the result of experience. The principles of reason are necessary, since they are the conditions of thought, and it is impossible to imagine their contrary; and universal, since they are applicable to all real or possible cases under the same conditions. The generally accepted principles are identity (*q.v.*), A is A; sufficient reason; contradiction, A is not not-A, a thing cannot be other than what it is; the excluded middle, A is either B or not-B, a thing must be either one thing or another; substance, the permanent element underlying the manifold and shifting phenomena; causality, everything has a cause.

Reason, as contrasted with instinct, denotes the mental faculties which distinguish men from other animals; it is also used as the opposite of insanity. The word is also applied to the faculty which enables us to apprehend intuitively, without analysis, certain truths, which are related to particular judgements as a reason to the consequence. Kant defines intuitive reason as the faculty which supplies the principles of knowledge *a priori*; pure reason is the faculty which supplies to principles of knowing anything entirely *a priori*; practical reason is the source of *a priori* moral principles. Understanding, as opposed to reason, is discursive. See Cause; Logic; Metaphysics; Rationalism.

Réaumur, RENÉ ANTOINE FERCHAULT DE (1683-1757). French physicist and naturalist. Born at

La Rochelle, Feb. 28, 1683, he went to Paris in 1703 to study mathematics and physics, and became a member of the Academy of Sciences, 1708. He made a

R. A. F. Réaumur, French physicist

study of the properties of iron and steel; invented a method of tinning iron that is still employed; experimented in artificial incubation; and wrote much on marine animals, insects, etc. He gave his name to the Réaumur scale (*v.i.*). His researches on spider webs led him to suggest the possibility of making synthetic silk from wood fibre. He died Oct. 17, 1757.

Réaumur Scale. The thermometric scale worked out by the above scientist in 1722. It was

based on the principle of taking the freezing point of water as 0° and graduating the tube into degrees, each of which was 1/1000th of the volume contained by the bulb and tube up to the zero mark. The boiling point of water, fixed at 80° , was arrived at by the coefficient of expansion of the particular alcohol used when Réaumur established his scale. The scale is now seldom used, the so-called Réaumur mercurial thermometer, with stem graduated into 80 equal parts between the freezing and boiling points of water, being a Réaumur only in name. *See* Thermometer.

Rebate OR **RABBIT** (O.F. *rabat*, recess). Step-shaped recess formed along the face of a wooden or stone member. Window frames are rebated to form a recess in which the glass pane lies. Rebates are used in joinery for receiving panels, which are secured in the recess by a bead or slip nailed in front. A rebate plane will finish the job in woodwork after the recess has been cut with another type of plane. Its blade is as wide as the body of the plane and protrudes through it from side to side, so allowing the tool to cut to its full width. *See* Plane.

Rebate. In commerce, an allowance or discount deducted in cases of prompt payment, or of proved inferior quality or short delivery of goods ordered. The term is also used for the deduction made from excise duties, rates, etc., under certain conditions. *See* Discount.

Rebec OR **REBECK**. Stringed instrument of Oriental origin, played with a bow.

Rebec, with bow

First mentioned in the 8th century, it seems to have gone out of fashion in the mid-17th century. Its shape was that of a pear cut in halves longitudinally. In the Middle Ages there were different sizes, forming a set corresponding to the various voices. A modification in the 12th century was called the rubbe or rybye, which eventually became the parent of the viol and the fiddle. There is a stone carving of the rebec in the crypt of Canterbury cathedral.

Rebecca. Character in Scott's novel *Ivanhoe*. She is the beautiful daughter of the wealthy Jew, Isaac of York. She defies the

advances of Bois-Guilbert, is accused of sorcery, and successfully championed by Ivanhoe. The character was suggested in part by a Philadelphia Jewess, Rebecca Gratz, whose story was told to Scott by Washington Irving in 1817, and retold by Gratz van Rensselaer in the *Century* magazine, 1882.

Rebecca Riots. Name given to riots that took place in South Wales in 1839 and more seriously in 1843. There were various reasons, economic and social, for the unrest, but the immediate one was the heavy charges at toll-gates. The rioters took hold of a passage in Gen. 24, in which it is said of Rebekah, "let thy seed possess the gate of those which hate them." They went about, often on horseback, often disguised as women, and destroyed many toll-gates and houses. Emboldened by success, they grew more formidable, and soldiers were sent to deal with them. They were then soon suppressed and their main grievance remedied.

Rebekah. In the O.T., sister of Laban and wife of Isaac. The mother of Jacob and Esau, she invented the plan by which her favourite son Jacob deprived Esau of his father's blessing. She was buried in Abraham's tomb in the field of Machpelah (Gen. 24-27, 49). As a popular first name among the Jews the name is commonly spelt Rebecca.

Rebus (Lat., by things). Allusive representation of a name or thing by means of pictorial devices; in other words, a pictorial pun. In heraldry, such devices were common during the Middle Ages. Similar devices were used by some early printers and others not possessing armorial bearings. Picture puzzles in the form of rebuses are popular competitions. *See* Allusive Arms.

Recalescence. Term given by metallurgists to a property of iron. If an iron wire is made red-hot in a flame, then removed, and allowed to cool, its bright colour will steadily disappear until the wire is quite dark, then, in a moment, after the wire has cooled a little more, it will suddenly glow again. This reappearing colour is the phenomenon of recalescence. It is supposed to be due to the fact that, when the cooling iron has reached a certain temperature, there takes place a change in the arrangement of the molecules of the metal, in which heat is liberated, though the temperature of the wire does not reach that of the first red-hot condition. *See* Steel.

Récamier, JEANNE FRANÇOISE JULIE ADÉLAÏDE BERNARD (1777-1849). French society leader. Born

Madame Récamier. From the painting by David, in the Louvre, Paris

at Lyons, Dec. 4, 1777, she came to Paris, 1784, married Jacques Récamier, a wealthy banker, 1793, and about 1798 became an intimate friend of Madame de Staël (*q.v.*). After her husband's bankruptcy, 1806, she lived with Mme. de Staël at Coppet, Switzerland, where she met Prince Augustus of Prussia, to whom she was for a time affianced. In 1811 she was forbidden by Napoleon, who feared her enmity, to live in or near Paris. She returned in 1815, was the intimate friend of Benjamin Constant, and her later years were passed with Châteaubriand until his death, 1848. Her salon at L'Abbaye-aux-Bois was a famous social centre. She died in Paris, May 11, 1849. *Consult* Madame R. et Ses Amis, E. Herriot, new ed. 1934.

Recanati. City of Italy, in the prov. of Macerata. It stands between the rivers Musone and Potenza, 6 m. from the Adriatic and 4½ m. from its station, Porto Recanati, on the coast rly. On a hill, at an alt. of 931 ft., it has remains of a 15th century wall and gate, and a 14th century Gothic cathedral. Founded in the 10th century, and important in the Middle Ages, it was damaged by earthquake in 1741, and was sacked by the French in 1799. The poet Leopardi was born here. Pop. 16,600.

Recapitulation. Biological doctrine of development. According to this doctrine organisms, in order to survive and succeed in the same environments as those of their parents, must closely resemble those parents, and this close resemblance can be obtained only by the development of the offspring along similar lines. The child treads in the footsteps of its parent, and the steps from embryonic life to adult development must be very similar to those previously taken by the parent. In other words, the child recapitulates the parental development. If it does not do so, the result is an individual unlike

the parent, and therefore unsuited to its environment, and as such it will inevitably perish.

Recca or **REKA**. River of the Carso in Trieste and Yugoslavia. It is noted for its waterfalls and caves. Its subterranean course runs from Canziano for 20 m., when the stream re-issues at San Giovanni with a width of 200 ft. and a depth of 6 ft. as the Timavo, and flows $1\frac{1}{2}$ m. to the Gulf of Trieste.

Receipt. Acknowledgment of payment. It is not necessary in English law. A debtor cannot refuse to pay what he owes because the creditor will not give him a receipt. A creditor who refuses to give a receipt in cases where the receipt should be stamped is, however, liable to a penalty of £10. A receipt is *prima facie* evidence of payment; but the person who gave it is always at liberty to show, if he can, that although he gave a receipt he did not receive payment; or that there is a mistake. The receipt is not conclusive against him, although the court would require very strong evidence to decide against an unconditionally worded receipt. With a few exceptions, a receipt for money of £2 or over must bear a twopenny stamp.

Receiver. In English law: (1) A person appointed by the court to hold property of any kind, and preserve it for the benefit of those persons who are ultimately held to be entitled to it. As soon as a receiver is appointed, he has possession of the property, and it is a contempt of court to interfere with his possession. Receivers are appointed in partnership actions, to preserve and realize the partnership property, collect the debts, etc., also in actions by debenture holders to realize their security, and in a large variety of other cases where it is beneficial to the parties to take the custody and control of assets out of the hands of the holder, and place it in the hands of an impartial and responsible person. Generally, a receiver is required to give security, to ensure that he will faithfully carry out his duties. (2) A person appointed by a mortgagee or debenture holder under a power in the deed to receive the rents and profits of the mortgaged property, and after paying expenses, to pay what is due to the mortgagee. (See Official Receiver.)

To receive property knowing it to have been stolen (including property acquired by false pretences, or extorted by threats) is a high

criminal offence. By English law the maximum punishment is imprisonment for 14 years. The English law allows evidence to be given, on a trial for receiving, that the prisoner is in possession of other property stolen within the previous twelve months; and it also permits the prosecution to prove that within the previous 5 years the prisoner has been convicted of a crime involving fraud or dishonesty. This forms a striking exception to the English rule that a prisoner on his trial shall not be prejudiced by the jury being informed of other crimes he has committed. The reason for the exception is that persons accused of receiving generally set up the defence that they had no reason to suspect that the goods were stolen.

Receivers of wreck are appointed by the Board of Trade from among the officers of customs, coast-guard, or inland revenue. When a vessel is wrecked or in distress the receiver must take charge of the persons present and give directions for the preservation of the vessel and cargo and the lives of those on board. Any person finding any wreck or cargo from a wreck must notify the receiver.

Receiving Order. Legal proceeding necessary for a bankruptcy. When in Great Britain, a person presents his own petition in bankruptcy, or a successful petition is presented against him by a creditor, the first step to be taken is to protect his assets. Accordingly a receiving order is made, the effect of which is to vest the whole of the bankrupt's property in the Official Receiver until such time as the creditors and the court shall decide what is to be done. After this receiving order is made, the bankrupt can no longer deal with his property, nor can anyone else. For example, a judgement creditor cannot proceed with an execution. The order does not extend to the debtor's personal earnings; but it includes all other property, whether in possession or reversion. See Bankruptcy.

Receptacle. In botany, the axis of the flower, to which the sepals, petals, stamens, and carpels are attached. See Flower.

Recessional (Lat. *recedere*, to withdraw). Hymn sung while clergy and choir withdraw after

church service. The title was used for the well-known poem by Rudyard Kipling with the refrain "Lest we forget," published in *The Times* immediately after Queen Victoria's diamond jubilee in 1897, and included six years later in the collection of his poems entitled *The Five Nations*.

Rechabites. Religious order of the Hebrews. Founded by Jehonadab, son of Rechab (2 Kings 10, vv. 15-28), who assisted Jehu to destroy the worshippers of Baal, the sect or clan calling themselves "sons of Rechab" maintained the religion of Jehovah in purity, abstaining from wine, settling nowhere, having no possessions, but living in the land as "strangers" (Jer. 35, vv. 6-7). At the approach of Nebuchadrezzar they took refuge in Jerusalem, and were held up to the Jews by Jeremiah as models of devotion and piety. The term was revived in the 19th century by a society of total abstainers known as the Independent Order of Rechabites.

Recherché Isles. One of the archipelagoes off the S. coast of W. Australia. The islands, with rocks and reefs, from E. to W. for nearly 200 m. were explored by a scientific expedition in 1921.

Recidivist (Lat. *recidivus*, falling back). In criminology (*q.v.*), a name given to an old offender, i.e. one who has been sentenced more than once for criminal offences. The recidivists comprise on an average half the prison population of the world, and in some countries the percentage is as high as 70. Efforts are being made in many countries to face the problem by methods of preventive detention and extended police supervision. The mentally defective form a large percentage of recidivists, and the problem of the reform of the recidivist is most difficult.

Recife. Oldest and chief commercial part of the city of Pernambuco (*q.v.*) in Brazil.

Reciprocal (Lat. *reciprocus*, alternating). In mathematics, the reciprocal of a function or quantity is such that when multiplied by the function or quantity the product is unity. Thus $\frac{1}{2}$ and 2 are reciprocal numbers, $a+b$ and $1/(a+b)$ are reciprocal quantities, etc. Reciprocal equations have their roots of the form a and $1/a$. A series of quantities form an harmonic progression when their reciprocals form an arithmetical progression.

Reciprocating Motion. Motion to-and-fro in a straight line, e.g. that of the piston and piston-rod of a steam engine. A crank is re-

Receptacle of the wild rose, shown at R

quired on the driver or driving shaft to convert reciprocating into rotary motion. Parts of machinery which move in this way are known as reciprocating parts.

Reciprocity. The condition of giving and receiving mutually. In politics the word is applied particularly to trade agreements in which one government confers rights on the other specifically in exchange for rights given to it; e.g. country A may undertake to admit certain classes of goods from country B at a lower rate of import duty in exchange for a comparable concession from country B. Such reciprocal undertakings are a normal feature of so-called bilateral trade agreements. See Free Trade; Imperial Preference; Most Favoured Nation Clause; Protection; Tariff Reform.

Recitative. Species of declamatory music in which the natural accentuation of the words combined with dramatic emphasis is the first consideration. It is entirely free as regards structure, and is thus sharply differentiated from the formal airs or choruses between which it occurs. It is of two kinds: *Recitativo secco*, in which the accompaniment is as light as possible, consisting of only a few chords, played originally from a figured bass; and *R. stromentato*, in which the accompaniment forms an essential part of the effect. For an example of each see Nos. 15 and 16 in Handel's Messiah. The dramatic scene is a development of accompanied recitative, while a great deal of Wagner's music is directly descended from it.

Recklinghausen. Industrial town in the Ruhr, Germany. It is 15 m. N.W. of Dortmund. Supposedly founded by Charlemagne, it became a town in 1236, a member of the Hansa in the 14th century, and from the 12th to the 16th century was owned by the archbishop-electors of Cologne. In 1803 it came to the duchy of Arenberg, in 1810 to the grand duchy of Berg, in 1815 to Prussia. There are a castle (1700), S. Peter's church (1276), and other public buildings (heavily damaged during the Second Great War). This is a rly. junction and a canal port, and its industries comprised coal-mining, iron works, engineering, chemical, and textile plants, and breweries. Captured by the U.S. 9th army, April 3, 1945, Recklinghausen lay in the British zone of occupation after the German surrender in May. Pop. (1950) 92,000.

Reclamation (Lat. *reclamare*, to dry out again). Act of winning

back or recovering. The word is chiefly used in connexion with the recovery of land from the sea. This requires engineering works for excluding the sea from foreshores in river estuaries covered at high tide, and the draining of low-lying tracts which are waterlogged by the overflow of streams passing through them, or by the lack of natural drainage. In some districts, where the general level is below that of the sea, exclusion of sea and river water and the expulsion of water already accumulated have to be effected under one scheme. This has been notably so in the Netherlands and the fens of E. Anglia.

To reclaim a foreshore, an enclosing embankment is formed rising above the level of the highest spring tides. In places where wave-action is strong, keeping the embankment in repair may entail a great deal of watchfulness, labour, and expense. Reclaimed ground is drained by ditches emptying into a main ditch running along the inside foot of the embankment. At intervals sluices from this ditch are cut through the dyke, with flaps at the outer end; so that water is discharged when it stands higher inside than outside, but cannot enter when the tides cover the sluices. If the fall is insufficient for gravity drainage, the water is lifted over the sea-wall by steam- or wind-driven pumps.

Fen land is protected by dykes from streams which flow through it. A system of drains and ditches leads the water to points where it is pumped or sluiced into rivers or artificial cuts. As the ground dries it consolidates and sinks, whereas the beds of streams tend to rise if much silt is present in the water they carry. Consequently the lift to be given by the pumps may increase considerably in time.

Reclamation of areas by covering them with mud, sand, or silt confined by an embankment or wall is practised only if the new ground will have high value and the material for filling is obtainable at small cost. The planting of long-rooted grasses helps to bind the soil and prevent erosion through seepage. The ideal conditions for this kind of work are found where material excavated by dredgers from a position in which it is obstructive can be turned to useful account to raise the level of land adjacent to the water where the dredger is operating. In Bombay harbour almost a square mile of ground was reclaimed by clay cut from the

bed of the harbour and delivered through long floating pipes. See Embankment; Fens; Netherlands; Pontine Marshes; Ysselmeer.

Recluse (Lat. *recludere*, to shut up). Man or woman living alone for the purpose of devotion to religion. In medieval days such persons were known as anchorites and anchoresses. They usually lived in a cell or small building attached to a church or convent. They were dedicated to the life by the bishop, and the entrance to the cell was usually closed. But the life of the inmate was not one of undue austerity, and popular ideas on the subject are greatly exaggerated. The recluse or anchorite was distinguished from the hermit by the fact that he remained within his cell, while the latter was under no such restriction. See Anchorite.

Recognizance. In English law, a written acknowledgment of a debt due to the crown, with a condition that the debt shall be void if such-and-such a thing is done, or not done. Thus a prosecutor is bound in the sum of £20, but the money is not to become payable if the prosecutor appears to prosecute the accused at the next sessions, etc. A surety for bail enters into a recognizance, promising to pay a certain sum; but if the prisoner shall appear to take his trial at the next sessions, etc., the recognizance is void. See Bail.

Recollet Fathers (ultimately from Lat. *recolligere*, to gather together). Name given to the Friars of the Strict Observance, a section of the Observantine branch of the Franciscan Order. An alternative spelling of the name is Recollect. They were founded about 1489 by Juan de Puebla in Sierra Morena, Spain, and did much missionary work in S. America. They also spread into Italy and France. These friars had charge of the sacred places of the Latin observance at Jerusalem. The name Recolletes has been adopted by a reformed branch of the Poor Clares. See Franciscans; Monasticism.

Reconnaissance. Military term for the employment of troops to obtain information in war as to the topographical features and resources of a country, or the movements and dispositions of an enemy. Strategic reconnaissance is required before the opposing armies are within striking distance of one another; the frontier raids which immediately follow a declaration of war are of this character. Tactical reconnaissance is the work of advanced guards and outposts when hostile forces are in contact and

battle plans are dependent on knowledge of the enemy's preliminary dispositions. Until the development of aeroplane and armoured car, reconnaissance was generally carried out by cavalry.

Reconnaissance by a large force of all arms, designed to provoke the enemy into revealing his dispositions by bringing him to action, is called reconnaissance in force (*see* Dieppe). In the static fighting of the First Great War, there was little opportunity or need of elaborate reconnaissance, but the mobile operations of the Second Great War rendered it essential.

In 1941 a reconnaissance corps was raised in Great Britain and trained on commando (*q.v.*) lines. One of its battalions was attached to each infantry division to provide a mechanised equivalent of the old divisional cavalry; each battalion had 850 men mounted on armoured cars, Bren carriers, and motor cycles. The corps had an anti-tank battery and mortar and machine-gun sections. Its function was to be in the van of an attack, reconnoitre the ground, delay and disorganize the enemy, and transmit information to divisional headquarters. Battalions served in Africa, Italy, and Burma. In Jan., 1944, the unit was absorbed by the Royal Armoured Corps (*q.v.*). *See* Patrol; Raid; Strategy; Tactics.

Reconstruction. Term used in commercial law. When a limited liability company has suffered heavy capital losses, and it is not desired that the concern shall cease business altogether, the company is often reconstructed. This may be done by winding up the company and transferring its business and assets to a new company, paying for the assets by shares in the new company which are only partly paid up. These shares are distributed among the old shareholders, each one becoming liable to pay certain further "calls" to provide more funds.

Thus, suppose the old company's capital was £10,000 in 10,000 £1 shares, all of which have been paid up, the new company will pay for the business and assets 10,000 £1 shares credited with 10s. paid up. The effect is that each shareholder will receive share for share, but he will have to meet a fresh liability of 10s. on each share. There are several other methods. *See* Company Law.

Reconstruction, MINISTRY OF. Dept. of the British govt. formed in 1917 to prepare for the end of the First Great War, its object being

to promote smooth demobilisation and conversion of industry from a war to a peace basis. It was later amalgamated with the ministry of National Service and wound up in 1920. During the Second Great War Lord Woolton was appointed minister of Reconstruction, Nov., 1943. The post was not continued when Winston Churchill formed his "caretaker" govt. in May, 1945. Woolton, however, as lord president of the council remaining responsible for reconstruction, duties connected with which were, under the Labour govt. formed in July, transferred to the ministries of Labour and National Service, Supply, Health, and Town and Country Planning.

Record. In English law, a collection of documents relating to an action. In the higher courts the writ of summons, the pleadings, and all material documents in the case down to the judgement are filed in court, and the whole of these together are called the record. Sometimes, when an action is compromised before trial, the parties ask the court to be allowed to withdraw the record, which is equivalent to asking that the case be withdrawn from the cognizance of the court. At one time all documents forming the record were engraved on parchment, and fastened together so as to form one long sheet. This sheet was then rolled up, and preserved in the custody of an official of the chancery, who was called the master of the rolls. Nowadays, such records are written on paper, and bound up, and are kept in the record office (*q.v.*), where they are accessible to the public.

Courts of record are those courts the judicial acts and proceedings of which are preserved. Such courts are divided into two classes, superior and inferior. The former include the house of lords judicial committee, court of appeal, high court, etc. The superior courts have the power to fine or imprison any person for contempt of their authority, but inferior courts can imprison only for contempt committed in court.

Record. A name given to a cylinder or disk of hard wax or other material for the reproduction of the human voice, musical sounds, etc. The perforated roll used in piano players is also known as a record, as is the perforated ribbon used in an automatic telegraphic apparatus. In general the mechanical or automatic register of any phenomenon is known as a

record, *e.g.* a record of rainfall. (*See* Gramophone; Sound Reproduction.) The word is also used, especially in sport, to indicate the supreme performance of its kind, *e.g.* the record score in cricket or the record time for a race. This use has extended to other fields, *e.g.* the record rainfall is the greatest quantity for a particular period.

Recorder. In England, a legal official of a city or borough. The appointment and duties of a recorder are regulated by the Municipal Corporations Act, 1882. Under this statute, when a borough or city has a separate court of quarter sessions the crown may appoint a barrister of 5 years' standing to be recorder. He holds office during good behaviour, and is a J.P. for the borough. He has precedence next after the mayor; but cannot be M.P. for the borough nor sit on the town council. Salaries are payable by the borough. *See* Quarter Sessions.

Recorder. Musical instrument of the fipple flute family, having a very attractive tone akin

Recorder. Wood-wind instrument akin to the flute

to the song of birds. It was a favourite instrument in Tudor times, and is referred to in Elizabethan literature, *e.g.* in Hamlet, act 3, scene 2. Like other medieval instruments, recorders were made in sets or "chests." At Chester there is an 18th century set of four, and at Nuremberg a 16th century set of eight. The instrument had eight finger-holes, and had a compass of about two octaves. It became known as the *flûte-à-bec* or English flute, and was eventually ousted by the stronger-toned transverse or German flute. Between the Great Wars there was in the U.K. some revival of the recorder, especially in schools.

Record Office, PUBLIC. British national institution. It is situated N. of Fleet Street, between Chancery Lane and Fetter Lane, London, E.C.4, on what was known as the Rolls Estate, and is the repository of records of the courts of law and government departments from 1100 to the present time. The buildings, in Tudor Gothic style, with tall, deeply embrasured windows, were designed, 1851-66, by Sir James Pennethorne and, 1891-1900, by Sir John Taylor, those at the Chancery Lane end, built in the

Record Office, London. Rear view of this fine building, seen across the air-raid devastation of the Fetter Lane area

latter period, and covering the site of the Rolls Chapel and the old court of the master of the rolls.

The muniment rooms are arranged along narrow concrete or brick-paved passages, the entrances to which are guarded by iron doors, and the presses in which the documents are preserved are of slate. The keeper of the records is the master of the rolls, and the staff includes a deputy keeper, secretary, and a number of assistant keepers. Facilities are offered for private research work, e.g. Dr. Wallace's Shakespearian discoveries were made by him when examining documents belonging to the court of requests, and students' tickets permit inspection of all legal documents down to the beginning of the 19th century, and the older records of most of the government departments. Legal records later in date than 1800, and census returns, may be seen on payment of fees, and the more recent departmental records can be inspected only by permission of the department concerned.

In England, public records were first ordered to be kept by Henry I early in the 12th century. Before the existing Record Office was built they were deposited in the Rolls Chapel, the Tower of London, the chapter house of Westminster Abbey, the state paper office in St. James's Park, and elsewhere. Among the treasures in the Record Office museum are William the Conqueror's Domesday Book, the Domesday chest, the earliest known printing of Caxton, the anonymous letter to Lord Monteagle which led to the discovery of the Gunpowder Plot, the black book of the exchequer, plan of the Kirk o' Field, log of

historic courts, and MSS. concerning the suppression of the monasteries. Many volumes have been issued under the aegis of the office, calendars of state papers, for example, as well as several unofficial works based upon private research among its archives; but masses of documents still await expert examination. During the First Great War many of the treasures were removed for safety to Bodmin; in 1939-46 they were at Shepton Mallet. See Sources and Literature of English History to about 1485, C. Gross, 2nd ed. 1915; Guide to the MSS. in the Public Record Office, M. S. Giuseppe, 1923-24.

Recruiting. Voluntary enlistment of men into a navy, army, or air force, as distinct from compulsory enrolment or conscription. Men so enlisted, termed recruits, bind themselves to agreed conditions of service for a definite period. In Great Britain an enlisted man officially ceases to be a recruit when he passes his course in musketry; thereafter he ranks as a soldier. Recruit training in the General Service Corps lasts six weeks, after which the recruit is drafted into a regiment or unit. The recruit takes the oath of allegiance, whereas the conscript does not. Administration of recruiting is under the dept. of the adjutant-general at the War office. In most countries, recruiting and conscription exist together. See Conscription; Derby Scheme; Enlistment; Militia; Press Gang.

Rectangle. (Lat. *rectus*, right). Plane, rectilinear, four-sided figure of which all the angles are right angles. The opposite sides are equal and parallel, and the area equals the product of two adjacent sides. See Geometry.

the Victory during the battle of Trafalgar, dispatch of Wellington relating to the battle of Waterloo, and the bull of Clement VII confirming Henry VIII in the title of defender of the faith, and the "scrap of paper" treaty of 1839. There are a long series of royal charters, patent rolls, records of the star chamber and other

Rectification. Term used in English equity, or chancery law. If a mistake has been made in a deed or document, either party can bring an action to have it set right; and the court, on proof of the error, will order that the deed or document shall be rectified. Although any branch of the high court has power to order rectification of a document, all actions for rectification ought to be brought in the chancery division, to which they are assigned by the rule of court.

Rectification. In mathematics, term used for the calculation of the lengths of curved lines. Such lengths are obtained theoretically by means of the integral calculus. In practice the lengths of curves are often obtained by means of an opisometer. A wheel is run along the line, and by noting the number of revolutions the required length is deduced. In chemistry rectification is a process of purification of liquids by means of fractional distillation.

Rectified Spirits, or SPIRITS OF WINE. Solution of ethyl alcohol in water containing 90 p.c. volume-in-volume. It is made by diluting 95 p.c. ethyl alcohol with water and is described in the British Pharmacopoeia. See Alcohol.

Rectifier. Electrical device for converting A.C. into D.C. Many types are in use. Mechanical rectifiers reverse the electrical connexions twice per cycle by a commutator driven from a synchronous motor in step with the A.C. supply, or by moving contacts mounted on a magnetised metal reed, made to vibrate in synchronism. A variation of the commutator type rectifier, with a number of revolving arms, is used in X-ray and other high-voltage work. Electronic rectifiers depend on the "valve" action of a stream of electrons, either in a vacuum or in an ionised gas such as mercury vapour, which gives unidirectional conductivity. The two-electrode radio valve is an example of the first, and the mercury arc rectifier of the second type. This latter is made in sizes ranging from a small glass bulb to a steel tank model, rated in thousands of kilowatts. The most common type for general purposes is the metal rectifier, which uses the unidirectional conducting properties of a film of copper oxide or selenium; it has a high efficiency, and is in demand for charging batteries. See Grid Rectifier.

Rector (Lat., ruler). In ecclesiastical law, an incumbent of a benefice who enjoys all the tithes,

whereas a vicar draws only a part. The word is also widely used in the U.S.A. for the incumbents of parishes in the Protestant Episcopal Church. The Roman Catholics use it mainly for the head of a religious house or college. At Oxford the heads of Lincoln and Exeter Colleges are known as rectors. In Scotland each of the four universities has a lord rector. He is elected by the students every three years and the office usually falls to a prominent politician or man of letters. Certain Scottish schools, e.g. Glasgow Academy, call their headmaster the rector. *See* Benefice; Ecclesiastical Law.

Rectum. Terminal part of the large intestine, ending in the anus. It is about 8 ins. long. Dilatation of the veins in the mucous membrane in the lower part of the rectum gives rise to haemorrhoids or piles. This condition may be due to weak walls in the blood vessels, or to back pressure resulting from constipation, or to fluid motions failing to dilate the anus and so aid circulatory change. Cancer of the rectum is most often a disease of middle or late life. The early symptoms are sensations of uneasiness, constipation with intermittent diarrhoea, and passage of bloodstained mucus. If the disease is diagnosed early, complete removal and recovery may be possible. A rectal fistula is an abnormal passage between the rectum and an adjacent organ or the external surface. The commonest form is a *fistula-in-ano*. A complete fistula opens internally into the bowel and externally through the skin.

Inflammation of the rectum is known as proctitis, and may be due to chronic constipation, new growths, or threadworms. Pro-lapse of the rectum is a condition in which a part of the tube protrudes through the anal orifice. It occurs in children and weakly persons, or may be the result of chronic constipation, piles, and other disorders of the rectum. In the early stages cure may be hoped for by relieving the cause of the condition, particularly in children. In adults, operative treatment may be necessary. Ulceration of the rectum may be due to chronic inflammation, dysentery, tuberculosis, or syphilis.

Reculver. Locality in Kent, England, the site of the Roman Regulbium. It is on the S. shore of the Thames estuary, 3. m. E. of Herne Bay. There are some remains of a fortress, and two towers, known as The Sisters, standing out boldly on the cliff, form a well-

Reculver, Kent. The towers called The Sisters, a well-known landmark for mariners

known landmark. They are remains of an E.E. church and belong to Trinity House. The modern church, S. Mary's, contains some relics of the earlier one. British and Roman coins have been found at Reculver. *See* Richborough.

Recuperator. Artillery device to return a gun barrel to the firing position after recoil. Recuperators are either spring- or air-operated. When the barrel recoils upon discharge of the projectile, the springs or compressed air in the recuperator act as a brake. Immediately the barrel has recoiled to its permissible maximum, the recuperator springs (or air) reassert themselves and, through a piston, push the barrel forward on its carriage to the firing position. The recuperator is initially in a state of compression to prevent the barrel sliding back in its cradle when the gun is elevated. Its forward movement is controlled by a throttle to prevent too rapid a return after firing. Heavy artillery pieces have two recuperators, mounted side by side on top of the barrel.

The apparatus of the same name used in metallurgy is described under Regenerator.

Recusant (Lat. *recusare*, to refuse). Name formerly applied to those who refused to conform to the Church of England. The word was mostly used in the 16th and 17th centuries with reference to Roman Catholics who evaded the penal laws which obliged them to attend services in the English churches. While poor recusants were imprisoned and exiled, fines imposed on the wealthier recusant county families were a considerable asset to the exchequer. *See* Toleration.

Red. One of the primary colours. The red rays of light are the least refracted in the spectrum. Red colouring matters may be divided into three classes: (1) natural; (2) synthetically prepared; (3)

mineral. The first includes limawood, barwood, camwood, etc., madder, cochineal, etc.; the second alizarin, etc.; and the third ferric oxide, red lead, sulphide of mercury, etc. Many of these colours are described under their separate names in this work. *See also* Dyes; Light; Pigment.

Red Admiral (*Vanessa atalanta*). Common British butterfly with a wing expanse of nearly 3 ins. The forewings are velvety black at the tips with white spots; then there comes a scarlet band, and towards their bases the wings are deep brown. The hind wings are also deep brown with a scarlet border. Common in gardens and hedgerows towards autumn, the butterfly is partial to rotting fruits. A few individuals apparently survive the winter, and a number of migrants arrive from the Continent in spring, to produce the abundant autumn generation of British-born individuals. The caterpillar is spiny and variably coloured; it feeds upon the common nettle and lives in a shelter formed of its leaves drawn together with silk.

Red Air Force. Popular name for the air force of the U.S.S.R. It was developed in the 1920s, chiefly under German direction; by the treaty of Versailles, Germany had been forbidden to build military aircraft within her territory, and the Red Air Force gave her technicians opportunities of trying out new ideas in construction and tactics. Few machines in the force were of Russian design, most being German and American, while all the aero engines were of British, French, German, or American design, built in Russia under licence. In 1939 there was only one Russian-designed aero engine in production.

When Germany invaded Russia in 1941, the defenders could put in the air a front-line strength of 160 squadrons: 35 fighter, 40

bomber, and the remainder reconnaissance; reserves totalling some 3,000 machines. Most of the bombers were of medium type, and there was no strategic force of heavy bombers capable of deep penetration into enemy territory. The Soviet aircraft industry was at first unable to supply the numbers of planes required, while a large proportion of those in service proved unsatisfactory. Russia still largely depended upon British and American machines. But as the war progressed, the aircraft industry underwent such rapid expansion that by 1945 about 75 p.c. of Red air force machines and engines were Russian-designed and built. Outstanding were the Yak fighter, the Stormovik assault bomber (army support), the Petlyakov twin-engined dive-bomber, and the Tupolev heavy bomber.

Few details were made public regarding the strength of the post-war Red air force, but in 1948 it was estimated that Russia could put some 3,500 aircraft into operation within a few weeks.

Redan. Military term for a V-shaped salient pointing towards the enemy. With the advance of modern military science it is almost obsolete, being chiefly remembered in connexion with the redans defending the S. side of Sevastopol, against which the British made a costly and unsuccessful attack, Sept. 5, 1855.

Red Army. Popular name for the military land forces of the U.S.S.R. The Red army developed from Bolshevik guerrilla forces raised during the revolution of 1917, and first became a cohesive fighting unit in the Russo-Polish campaigns of 1919-20. Originally it was on a strictly proletarian basis: officers and men received the same rate of pay, lived and messed together, and there were no badges or other insignia of rank. In 1930 the Red army was reorganized by German instructors. The officers were granted military status with fixed ranks, distinctive insignia, and regular promotion, while the men were given privileges denied to civilians. To prevent the officer caste from becoming a threat to the political regime, every formation of battalion strength and over had attached to it a political commissar, who had authority over military commanders. But this chaotic state of affairs was ended in 1939 by the abolition of the post of political commissar.

At the outbreak of the Second Great War, the Red army had an

effective strength of 1,600,000 men; by the end it had nearly 16,000,000. In 1948 it was reduced to a peacetime establishment of 1,900,000, including para- and semi-military formations, militarised police, and troops of the ministry of the interior. Service is compulsory for all men between 16 and 60, and the average annual intake is 1,500,000. Peasants, many illiterate, form the bulk of the infantry, but the mechanised formations are all drawn from industrial workers who are members of the Communist party. Cadets for commissions attend courses in military and political theory. See Russo-German Campaigns.

Red Bean (*Sophora secundiflora*). Small evergreen tree of the family Leguminosae. It is a native

Red Bean. Foliage and flower spike

of Texas, U.S.A. The glossy leaves are broken up into oval leaflets, and the violet flowers are in long sprays. The seed-pods contain five or six hard, glossy, scarlet beans which contain a poisonous alkaloid having physiological effects similar to the action of tobacco. They were formerly much used by the Indian tribes as an intoxicant, the bean being reduced to powder and dissolved in *mescal*, the spirit distilled from the fermented sap of the agave. Half a bean produced a delirious exhilaration, followed by a sleep lasting two or three days; a whole bean would kill a man.

Redcar. Mun. bor. and seaside resort of the N. Riding of Yorkshire, England. It is 8 m. N.E. of Middlesbrough, with a rly. station. There is a magnificent stretch of sandy beach, with good bathing and golf links, and the town is a popular resort especially for the people of Middlesbrough and Stockton. Four race meetings are held annually. The bor. includes Coatham. Pop. 26,500.

Red Chalk. In geology, bed 4 to 10 ft. in thickness found in the counties of Norfolk and Lincs, England. It occurs beneath the

lower chalk and is equivalent to the gault in S. England.

Red Clay. Material which is being deposited in the abyssal depths of the oceans. It is composed of insoluble remains of small sea creatures (plankton), wind blown dust, volcanic ash, and meteoric dust. As these materials sink slowly through the water their soluble constituents are removed and the residue only accumulates. The rate of sedimentation is estimated at half a centimetre in 1,000 years. Whales' earbones and sharks' teeth (many of extinct species) have accumulated in the Red Clay and are commonly dredged up. Manganese oxide nodules and zeolites also occur. No deposit corresponding to the Red Clay has been found in the sediments now uplifted and exposed on land, a fact which supports the theory that ocean basins are permanent features.

Red Crag. In geology, a group of current bedded sands of Pliocene age. They are found in England in a roughly triangular area between Walton-on-the-Naze, Sudbury, and near Aldeburgh, in Suffolk and Essex.

Red Cross. International emblem of an organization whose history is described under International Red Cross.

Red Cross, AMERICAN. Relief organization of the U.S.A. inaugurated 1881, mainly through the efforts of Clara Barton (1821-1912), first president. It was re-organized in 1905 under a charter granted by congress, and in 1947 a revision of this charter placed it under a board of 50 governors. It not only gives aid to the sick and wounded during war, but relieves the victims of floods, fires, tornadoes, epidemics, and other calamities at all times, whether at home or abroad. Among its activities are public health services; e.g. for accident prevention, home nursing, first aid in drowning. In 1945 a civilian blood donor service was started. With headquarters in Washington, D.C., there are 3,751 local chapters and over 5,000 branches.

Red Cross, ROYAL. British decoration instituted in 1883 for nurses who tend the sick and wounded of the army and navy. It is granted in two classes; recipients of the first class are entitled as members to the letters R.R.C. after their names, those of the second class as associates use the letters A.R.R.C. Members wear a cross, enamelled red, edged with gold, having on the arms

thereof the words faith, hope, charity, and the date 1883; the centre bears the royal and imperial effigy; on the reverse are the words, date, cipher, and crown.

Royal Red Cross.
Decoration for nurses

Associates wear a cross of the same form and size, but of frosted silver, upon which is superimposed a Maltese cross, enamelled red, the centre bearing the royal and imperial effigy; on the reverse are the words, date, cipher, and crown above-mentioned. The cross is worn on the left breast attached to a dark blue riband, edged red, and tied in a bow; it is worn only on indoor uniform. All members of the nursing service are eligible for this decoration, which may be conferred also on other persons, British and foreign, who render service to sick and wounded British soldiers and sailors.

Red Cross Knight, THE. Principal character of Book 1 of Spenser's *Faerie Queene*. He is regarded as a personification of reformed England, or as symbolising the victory of holiness over sin. In one line he is referred to as Saint George of Merry England. With Una, personified Truth, he sets forth as her champion to slay the dragon, which is Falsehood. Deceived by the wizard Archimago, he gets separated from Una, and they meet many adventures separately before the dragon is slain and they are reunited and betrothed.

Red Cross Society, BRITISH. Founded in 1870 to tend the sick and wounded in war and to alleviate distress in peace. The society is autonomous and independent, but adheres to the rules of the International Red Cross (*q.v.*). In peace time it instructs in first aid and maintains ambulance and X-ray services in country districts. In war it supplements the civil and military medical services and provides amenities which fall outside official provision.

In both Great Wars this society and the Order of St. John formed a joint body, the Red Cross and St. John war organization, the existence of which did not affect the status, duty, and privileges of either body. In the Second Great War this was the only body authorised by the British govt. to send standard parcels, of which 19,326,196 were dispatched, to prisoners of war. Through a wounded-and-missing department it searched for

missing men of British and dominion services and merchant navies; it arranged letter services to occupied territories; trained 500,000 men and women of the civil defence services in first aid; established hospitals and homes to accommodate 15,000 patients; set up nearly 200 depots for storage of medical supplies against any emergency; augmented civil defence services with ambulances, personnel, auxiliary hospitals, medical stores, clothing, and monetary grants. Its activities were made available to all Allied countries, and over £1,000,000 worth of stores and medical supplies were sent to Russia. Red Cross welfare teams accompanied the armies on all fighting fronts, and four ambulance trains and 1,200 vehicles were provided. In 1939 the duke of Gloucester's Red Cross and St. John appeal was launched to raise funds, and by June 30, 1945, over £53,000,000 had been subscribed. In a penny-a-week fund, 14,000,000 workers contributed a total of £17,622,225. The Red Cross society's offices are at 15, Grosvenor Crescent, London, S.W.1.

Red Deer (*Cervus elaphus*). Largest species of deer now found in Great Britain. It was formerly common in the forests throughout the British Isles, but now occurs wild chiefly in the Highlands of Scotland and in the western islands, on Exmoor, and in Kerry. The strain was greatly modified in the 19th century by the importation of stags from Germany and Austria. The stag stands about 4 ft. high at the withers, the hind being about 6 ins. shorter, and the weight of a fine specimen may attain 400 lb. The pelt is reddish brown, sometimes tinged with grey on the upper parts, and much lighter beneath, with a yellowish patch on the rump. A reddish tinge is peculiar to the summer months. The Irish variety has a white blaze on the forehead. Fawns are lighter in tone, and are spotted with white.

The stags carry fine antlers, the number of branches or tines roughly indicating their age. In a good specimen the antlers may measure a yard in length, and have an expanse between the two tips of about 40 ins. They are shed annually about March and at once begin to grow again, being covered with hairy skin, known as the "velvet," until they reach completion about Sept. During this time the stags are timid and harmless, but the completion of the growth of the antlers marks the

beginning of the mating season, when the stags fight furiously for possession of the hinds. The stag is polygamous, and has even been known to collect a harem of fifty hinds. The fawns are usually born in May and June, one at a birth.

Red deer feed upon grass, young shoots, fungi, and beech nuts, and are said to eat the dry seaweed on the shores of some of the western islands of Scotland. They are also fond of licking rocks washed by the waves for the sake of the salt. They usually feed in the early morning and late in the afternoon, lying up in shady spots during the hotter hours. They have keen scent and are wary, so that the deer stalker in the Highlands has need of all the skill and patience he can bring to bear on his pursuit. See Antler; Deer; Deer-stalking.

Red Deer. City of Alberta, Canada. It is an important junction on the C.P.R. and C.N.R. It is 90 m. N. of Calgary, and stands in the centre of a farming district on the Red Deer river. Coal is mined in the vicinity, there are lumber mills and elevators, and the industries include creameries and making creosote. Pop. 2,924.

Redditch. Market town and urban dist. of Worcestershire, England. It stands on the Arrow,

13 m. S. of Birmingham, with which it is connected by rly. and bus. Long established industries are the manufacture of needles and pins and fishing tackle; motor and pedal cycles, motor and aeroplane parts, electric batteries, and forgings and castings, are also turned out. Remains of the Cistercian abbey of Bordesley, 1138, are of historical interest. Market day, Sat. Pop. est. 28,000.

Reddle. Most earthy variety of the mineral haematite. Red in colour, it is used in paint, for polishing glass, and in making crayons. A reddleman was one who travelled with this commodity; such was Diggory Venn in Hardy's *Return of the Native*.

Redeemer (Lat. *redimere*, to buy back). Term used as a synonym for Jesus Christ because of His work in redeeming the world from sin. The Redemption is a theological term for this work. See Atonement; Jesus.

Redemption. In financial matters, the repayment of a loan after a certain time, and on stated terms. Municipalities often

Redditch arms

raise money by redeemable stock, as it is called, one condition being that at the end of a certain time the lender shall be repaid, sometimes with a small premium. Debenture stock issued by public companies is often redeemable.

Redemptorists (Lat. *redemptor*, redeemer). R.C. religious congregation of priests and lay brothers (about 7,000 strong), called the Congregation of the Most Holy Redeemer. It was founded by S. Alphonsus Liguori at Scala in 1732 to undertake missions and retreats. The Redemptorists came to England in 1843, and S. Mary's, Clapham, founded in 1848, became the provincial house in this country. The first English provincial—Newman's friend, Robert Coffin—was later bishop of Southwark. Today the English province comprises eight houses, and has a dependent vice-province in S. Africa. S. Alphonsus also founded an order of nuns—commonly called Redemptoristines—who are contemplatives devoting themselves to prayer and penance. They wear a distinctive habit, red tunic, blue scapular, and white headdress with black veil, and their English house is at Chudleigh.

Red Ensign: For this flag of the Merchant Navy, see Ensign; Flag and colour plate.

Redesdale. District of Northumberland, England. It consists of the valley of the river Rede, or Reed, and extends for about 20 m. from the Scottish border to the N. Tyne at Reedsmouth. The dale forms one of the main routes between England and Scotland, and the men of Redesdale won notoriety as doughty fighters in many a border foray. Otterburn is at the S. end of the valley, in which are the Roman station of Bremenium, and Newcastle's water reservoir.

Redesdale, BARON. Peerage of the U.K. held by the family of Freeman-Mitford. John Mitford (1748–1830), a Northumberland landowner who became attorney-general in 1799 and speaker of the house of commons in 1801, was given the title in 1802 and assumed the additional name of Freeman. His son John (1805–86), was raised in 1877 to an earldom, but this title expired with him. In 1902 the barony was revived in favour of a kinsman, Algernon Bertram Freeman-Mitford (1837–1916), diplomatist and M.P. When he died, Aug. 17, 1916, it passed to his son David Bertram Ogilvy (b. March 13, 1878). He had one son, Thomas David (b. 1908, killed in Burma, 1945), and six daughters.

Of these Nancy (b. 1904) was a successful novelist, among her books being *Pigeon Pie*, 1940, *The Pursuit of Love*, 1945, *Love in a Cold Climate*, 1949; Diana (b. 1910) married 1st, Bryan Guinness; 2nd, Sir Oswald Mosley (*q.v.*); Unity Valkyrie (1914–48) gained notoriety as a friend of Hitler.

Red Flag, THE. British Socialist song, written in 1889 by Jim Connell. He intended it to be sung to the air of *The White Cockade*, but as this was in use about the same time for a vulgar music-hall song the hymn-tune *Maryland* was used instead. Bernard Shaw said the tune sounded like "the funeral march of a fried eel," and Bantock at one time reset a Beethoven air for it, but this was not generally adopted. The song has often been sung by Socialists to express defiance or triumph, e.g. in the house of commons after their election victory of 1945. Red is traditionally recognized as the symbolic colour of international Socialism, hence the red field of the flags of the various republics of the U.S.S.R. and the use of the term "red" to signify an extreme Socialist. The words of the first verse and refrain of *The Red Flag* are as follows:

The people's flag is deepest red;
It shrouded oft our martyred dead,
And ere their limbs grew stiff and cold,
Their heart's blood dyed its every fold.

Then raise the scarlet standard high!
Within its shade we'll live and die!
Though towards finch and traitors
sneer,

We'll keep the Red Flag flying here!

Red Fleet. Popular name for the naval forces of the U.S.S.R. As her European coastlines, except in the N., border on inland seas, the principal strength of the Russian fleet has always been in small craft. At the outbreak of the Second Great War, all the battleships and many cruisers were vessels of the old imperial navy, the only recent ships being 23 destroyers, 134 submarines, and 150 torpedo boats. This fleet was strengthened by the loan of the British battleship *Royal Sovereign*; and one new cruiser and a number of destroyers were commissioned. Throughout hostilities the Red Fleet was in no sense a sea-going force; its units played a minor role, and then only in Russian waters, in the escort of Allied convoys. Russian destroyers, submarines and coastal craft were active in the Baltic and off the Crimea, but the seamanship of crews was generally of a low standard. In 1940 the practice of appointing political commissars to every ship was abolished. By 1943

the Red Fleet consisted of three battleships built between 1911 and 1915; eight cruisers, the largest 8,000 tons, commissioned between 1915 and 1940; 140 submarines, all modern, many seized from Germany; 50 destroyers, of which at least half were 15 years old; and 200 torpedo boats, nearly all modern. The original division into Baltic and Black Sea fleets lapsed with the completion of the Baltic White Sea Canal. Principal dockyards are at Nevsky, Leningrad, and Kronstadt.

Redgauntlet, A TALE OF THE EIGHTEENTH CENTURY. Nineteenth of the *Waverley Novels* by Scott. It abounds in scenes of abiding interest and charm, touched with the glamour of expiring Jacobinism, and told in part through the media of letters and journals. The period is 1766, and the scenes are laid in Cumberland and the Scottish borders of the Solway. Alan (or Saunders) Fairford recalls Scott's father; Alan Fairford is autobiographical; Lillias Redgauntlet is a memory of the author's youth; the romantic Darsie Latimer is a portrait of Scott's friend, Will Clerk. Wandering Willie, the blind fiddler (whose weird Tale of the Redgauntlets fired the imagination of Stevenson, and is by many regarded as the finest short story in the language), Nanty Ewart, Peter Peebles, and the Quaker Geddesses are notable characters.

Redgrave, MICHAEL SCUDAMORE (b. 1908). British actor. His mother was the actress Margaret

Michael Redgrave,
British actor

Scudamore, and he was born March 20, 1908. Educated at Clifton and Magdalene College, Cambridge, he taught at Cranleigh, but in 1934 joined the Liverpool repertory company and in 1936–38 acted with the Old Vic players. He made a reputation in *Thunder Rock*, 1940, and added to it in a revival of *A Month in the Country*, 1943, and *Uncle Harry*, 1944. Entering films in 1938, he appeared in *The Lady Vanishes*, *The Stars Look Down*, *The Way to the Stars*, *The Captive Heart*, and also *Kipps*. Redgrave married the actress Rachel Kempson.

Red Guard. Former regiment of the Soviet army. Red guard units were raised in all the principal Russian cities after the Ger-

man invasion of 1941, and took an oath to "stop Hitler or die." They were abolished at the end of the war.

Redhill. Market town of Surrey, England, part of the mun. bor. of Reigate. It is 21 m. S. of London, on the Brighton road A 23, and is an important rly. junction. The town takes its name from the red sand formerly dug on the common here.

Redhill, Surrey. Cross roads in the centre of the town, looking up Station Road

Fuller's earth is obtained in the neighbourhood. The Philanthropic Society maintains a large reformatory farm-school for boys here. At Earlswood is an institution for mental defectives; also a common, upon which also stands a county hospital. *See* Reigate.

Red Hill. Pre-historic mound of burnt earth, found especially in Essex. Scattered along estuary and tidal river margins, not more than 5 ft. above high-water mark, they are low, flat masses, varying in size from a few rods to several acres. Some hundreds are extant. An exploration committee appointed in 1906 spent four seasons in excavating typical examples, and presented reports to the Society of Antiquaries in 1908 and 1910. It was found that the loose burnt clay was sometimes intermingled to the extent of about 1½ p.c. with fragments of coarse earthenware called briquetage, comprising so-called firebars, pedestals, and T-pieces. Occasional Samian potsherds apparently date the mounds not later than the 1st century A.D. Fragments of charcoal, never exceeding 1 in. across, came from furze, broom, and the commoner forest trees.

Similar briquetage found in Lorraine and Belgium pertains to open earthenware furnaces, using brushwood fuel, for crystallising common salt from brine. Whether the Essex Red Hills are the debris of salt-works, kelp-works, or other industries, whether they mark the actual sites of the clay-burning, and what purpose, if any, was

served by the burnt earth, are still under investigation by scholars.

Red Indian. Popular name for the American Indian. They were so called from the colour of the skin. *See* American Indians.

Redistribution. In politics, a change in the size and number of the constituencies returning members to parliament. It is usually made to meet the changes brought

about by the movements of population. In the U.K. the first great redistribution of seats was effected by the Reform Act of 1832, when a large number of small boroughs were deprived of the privilege of sending two members to parliament, and large places were given

it. Time made further less drastic redistribution necessary in 1867, 1885, and 1918.

The Second Great War having occasioned exceptional movement of the population, the Redistribution of Seats Act, 1944, temporarily sub-divided 20 large English constituencies into 45, and set up boundary commissions to undertake a full-scale redistribution. At the 1945 general election there were 640 seats. The boundary commissions' reports, 1948, gave England 489 single-member constituencies, Scotland 71, Wales 36, and N. Ireland 12, a total of 608, excluding the universities' and City of London seats. The latter were abolished by the Representation of the People Act, 1948, which created a further 17 new constituencies. The total of constituencies and of seats thus became 625, the average electorate being 56,758.

In some countries redistribution is brought about automatically. In Canada, for instance, the representation of Quebec in the house of commons is fixed at 65 members, and the other provinces send numbers that bear the same proportion to 65 as their population does to that of Quebec, the change being made after every census. *See* Commons, House of; Representation.

Red Lead. Commercial product which has the chemical composition of minium (*q.v.*).

Red-letter Day. Saint's day or feast marked in the Church calendar by red letters. Hence the term is commonly used for a day made

memorable by some particularly desirable event.

Redmarley d'Abitot. Village of Worcestershire, England. Situated 9 m. W. of Tewkesbury in the extreme S.W. corner of the co., it stands on the summit of a hill, Red Marley, which is used for R.A.C. reliability trials of cars. The village consists of timbered and half-timbered houses. A former village of Redmarley now forms part of Great Witley.

Redmond, JOHN EDWARD (1851-1918). An Irish politician. Born at Ballytrent, he belonged to a family of landowners long associated with co. Wexford, his father and grandfather having sat in parliament for Wexford borough. Educated by Jesuits at Clongowes, and at Trinity College, Dublin, John became a clerk in the house of commons and a barrister, but in 1881 turned to a political career and was returned as Nationalist M.P. for New Ross. His abilities as a speaker and family connexions made him prominent in the party; he was sent to Australia to collect funds, but in 1887 he suffered a short imprisonment under the Crimes Act.

When the split in the Nationalist party occurred, Redmond adhered to Parnell, and on his death

John Redmond, Irish politician Russell

he was chosen leader, and this position he retained until his death. In 1885 he was returned for N. Wexford, and from 1891 onward represented Waterford city.

Under Redmond's leadership the Nationalists worked in parliament by constitutional means. He was a member of the land conference of 1904, and after the Liberals came into power in 1906 he obtained from them several measures for Ireland. After the first election of 1910 his party held the balance of power in the house. He accepted warmly the Home Rule bill of 1912. Redmond showed a willingness for concessions to Ulster, was embarrassed by the enrolment of Irish volunteers, and was a member of the abortive conference at Buckingham Palace in July, 1914.

The growth of the Sinn Fein movement was a terrible blow to

his power, work, and hopes, even though Home Rule in a suspended fashion became law in 1914. The divergence between him and the Sinn Feiners widened when, on the outbreak of the First Great War, Redmond promised the support of Ireland. He did something to encourage recruiting, but refused to join the coalition cabinet in 1915. In truth, he could no longer rely upon his people, and another blow was the Irish rebellion of 1916. Meanwhile he secured for Ireland exemption from conscription, and was a member of the Dublin convention; but before the triumph of Sinn Fein at the general election he died, March 6, 1918.

Redmond's career as an Irish leader was a failure; the middle course he sought to steer was not acceptable to the majority of the nation, with whom he lost touch. But in parliament he was a success. He was a finished speaker, almost an orator of the old school, and his knowledge of the forms and procedure of the house of commons was profound. He married an Australian, Johanna Dalton, and had a son and two daughters. *Consult* Life, D. Gwynn, 1932.

Redmond, WILLIAM HOEY KEARNEY (1861-1917). Irish politician, younger brother of J. E. Redmond. Educated by the Jesuits at Clongowes, he abandoned an army career for politics, and was twice jailed for his share in the land league movements. Nationalist M.P. for Wexford borough, 1883; for Fermanagh, 1885; and for E. Clare, 1892, he supported Parnell in the split of 1890, and remained an active follower of his brother both in and out of parliament. At the outbreak of the First Great War, although over military age, he took a commission in the Royal Irish regt., and publicly urged other Irishmen to enlist. As a major, he died June 7, 1917, of wounds received in leading an attack near Wytschaete.

Redon. Town and river port of France. In the dept. of Ille-et-Vilaine, it stands on the estuary of the Vilaine and on the canal between Brest and Nantes. The chief building is the Gothic church of S. Sauveur; its earliest part dates from the 12th century and it has a detached belfry. The Benedictine abbey, founded here about 820, was long a famous religious house. Pop. 7,000.

Redoubt. Military fortification entirely enclosed by earthworks. It is principally used for resisting infantry attack, and seldom as part of a permanent defence system,

for it offers a prominent target for enemy artillery. Redoubts are set up as supports for the second line of defence or for defending open lines of communication. In the present-day warfare of movement the redoubt has largely been replaced by the more mobile "box." *See* Knightsbridge.

Redpoll (*Carduelis flammea*). British song-bird. Closely related to the linnet genus, it is found

Redpoll. Crimson-headed song-bird related to the linnet genus
W. S. Berridge, F.Z.S.

chiefly in the N. districts of Great Britain; also in Europe, Asia, and N. America. The plumage is reddish brown on the upper parts, with a deep crimson crown, pink breast, and white under parts. In habits and song the redpoll much resembles the linnet. It feeds upon insects and seeds. *See* Eggs, colour plate.

Redress. Relief or reparation. Redress of grievances was a common phrase during the struggle in England between king and parliament in the 17th century. The house of commons then established the principle that redress of grievances by the king must precede a supply or a grant. *See* Charles I; Petition of Right.

Red River. Alternative name for the Hong-Kiang (*q.v.*), a river of S.E. Asia.

Red River. River of the U.S.A. The southernmost affluent of the Mississippi, it takes its rise near the E. boundary of New Mexico, and flows E. between Texas and Oklahoma, enters Arkansas, and runs S.E. through Louisiana. Its chief tributary is the Washita. Some of its waters are carried to the Gulf of Mexico by bayous. It is about 1,500 m. long, and is navigable for 1,250 m. Vessels of 4 ft. draught can ascend to Fulton, Ark., 508 m. up. At Denison (*q.v.*), Tex., is the largest earthen dam of its kind in the world.

Red River. River of N. America. It rises within a few miles of

the source of the Mississippi on the Height of Land in Minnesota, U.S.A., and flows S., then W., and finally N. between N. Dakota and Minnesota into Manitoba, Canada, where it enters Lake Winnipeg after a course of 700 m. It traverses an almost level plain formerly covered by Lake Agassiz; here wheat is produced in great quantities. The river is liable to floods, since the upper ice melts before the more northerly lower ice. It is navigable from Winnipeg to Grand Forks, and in flood time small steamers are able to navigate one of its branches through Lake Traverse to the Mississippi. Its length is 700 m.

Red River Settlement. A former colony in Canada, lying in the valley of the Red River, S. of Lake Winnipeg, now part of the prov. of Manitoba. It was founded in 1811-12 by Thomas, 5th earl of Selkirk. By 1836 the Hudson's Bay Company had acquired full rights of control in the settlement, but when in 1869 the company's rights were transferred to the dominion of Canada, there was strong opposition among the population of this district, largely of mixed French and half-breed blood. Under the presidency of Louis Riel (1844-85), a provisional government was set up to oppose annexation, but the rebellion was suppressed by a mixed Canadian and British force dispatched under command of Wolseley (*q.v.*), who entered Fort Garry in 1870.

Redroot. Alternative name for the plant more commonly known as blood root (*q.v.*).

Red Rot (*Fomes annosus*). Woody fungus of the family Polyporeae. It is very destructive to coniferous trees. The visible portion, the spore-bearing body, is evident on the trunks and exposed roots of infected trees as a thick rugged knob, of which the white portion is pitted with the openings of the spore-bearing tubes. The mycelium penetrates the woody tissues and breaks down the cells, reducing them to a soft condition.

Redruth. Market town of Cornwall, England, part of the urban district of Camborne-Redruth. It is 9 m. W.S.W. of Truro and 63 m. W. of Plymouth, with a rly. station. It stands on a hill in the midst of a tin and copper mining district, and most of the industries are connected therewith, though various light engineering industries were established in the 1930s. Horse and cattle fairs are held. There is in

Redruth, Cornwall. Ruins of Carn Brea Castle

the district a famous school of mines. The chief buildings are S. Uny's church, town hall, market house, science and art school, and museum. In Camborne is S. Martin's church, which has an unbroken record of rectors since 1308. The church itself was restored in 1862. Near the town is Carn Brea, a rock 749 ft. high, on which are some remains traditionally associated with the Druids, and a ruined building known as Carn Brea Castle. In 1792 gas was first used here for lighting, being introduced by William Murdoch. Pop. (district) 35,170.

Red Sea. Arm of the Indian Ocean. It occupies the trough of a portion of the Great Rift Valley between Arabia and N.E. Africa, and extends from the isthmus of Suez 1,200 m. to S.S.E., to the Strait of Bab-el-Mandeb. At the N. end are two arms, the Gulfs of Suez and Akaba. From 100 to 200 m. wide, it has coasts fringed with coral reefs and lined by sandy deserts. Down the middle the channel is usually 3,000 ft. deep; the deep waters have a uniform temperature of 71° F., the surface waters vary from 77° F. in the N. to 84° F. in the S. Evaporation is continuous, and the hot humid air above the sea is depressing. Since the earliest times the Red Sea has been a marine highway, and has been used by steamers since the opening of the Suez Canal in 1869.

Owing to its position between Egypt and Arabia, the Red Sea was familiar to the ancients. It is the most important seaway referred to in the O.T., and was crossed by the Israelites in their exodus from Egypt. The exact spot where they crossed the sea is purely a matter of surmise, but in all probability it was near Baal-Zephon. The story of their passage and the pursuit and destruction of Pharaoh's host is recounted in Exodus, chap. 14, and the place reached on the other side is identified as Ayun Musa (Fountains of Moses). The Red Sea was known to the Romans as Mare

Rubrum, its two arms being called Heroöpoliticus Sinus and Aelanites Sinus, the Gulfs of Suez and Akaba respectively. Its historical associations are linked with those of Egypt (*q.v.*). The first historic civilization probably entered the land across the desert road from the Red Sea to Koptos. The Red Sea figured in all subsequent invasions, Assyrian, Syrian, Turkish, etc., and has always been a noted commercial highway. On Nov. 3, 1914, the British warship *Minerva* bombarded Akaba at the head of Akaba gulf, thus inaugurating the war against Turkey.

Early in the Second Great War, German and Italian aircraft and submarines rendered the Mediterranean passage to the British Middle East theatre untenable, so that all supplies and reinforcements to Egypt had to pass through the Red Sea after rounding the Cape. Although they achieved little, the Italian submarine and destroyer forces based on E. African ports on the Red Sea were a constant threat to Middle East convoys until the Italians in E. Africa were defeated in 1941. See Aden; Africa; Arabia; East Africa Campaign; Sinai; Suez.

Redshank (*Tringa totanus*). British shore bird. It belongs to the family containing sandpipers,

Redshank. Bird of the plover family, common on the sandy eastern shores of Britain
W. S. Berridge, F.Z.S.

snipes, and curlews. The plumage is pale brown on the upper parts, with a tail barred with black and white, and whitish under parts. In winter the plumage tends towards grey. The legs and feet are bright orange red, and the body is about 12 ins. long. Moderately common on the sandy shores of the E. counties of England, the bird feeds upon crustaceans and marine worms. Its wider range includes Europe, Asia, and Africa.

Red Spider. Name given to small bright red mites that infest various greenhouse plants besides others grown in the open. Under

glass the species *Tetranychus ulmi* attacks tomatoes, cucumbers, carnations, etc. In the open

Red Spider. Common garden pest

grew, they are caused by their piercing mouth-parts, which suck the sap, usually from the under side of the leaves. Treatment is spraying with lime sulphur.

Red Square. A vast thoroughfare in the centre of Moscow. A parade ground for displays and demonstrations, it is 900 yds. long and 175 yds. wide. On the W. is the Kremlin outside which is Lenin's tomb; at the S. end, the cathedral of S. Basil; at the N. end the historical museum. The name dates from much earlier than the revolution; in the time of Ivan the Terrible the square was the scene of public executions.

Redstart (*Phoenicurus phoenicurus*). Migratory song-bird. It is to be seen between April and Sept.

Redstart. European song-bird
W. S. Berridge, F.Z.S.

in most districts in England, but is nowhere common. It is found in the N. and central regions of the Continent. The cock bird has bluish-grey plumage on the upper parts, with black throat and bright bay under parts. The hen is reddish grey on the upper parts, with pale red breast and flanks and whitish throat.

Red Tape. Derogatory term applied to bureaucratic formalities and delays. It originated from the pink tape with which govt. dept. documents were tied. A civil service journal is entitled *Red Tape*.

Reducer. In photography, a chemical used to dissolve away part of the silver deposit when an image is found to be too dense. Reducers are known as cutting, proportional, or super-proportional, accordingly as they (a) attack the lighter deposits first, thereby increasing contrast; (b) act evenly on all deposits; or (c) attack the denser portions first,

thereby decreasing contrast. There are many reagents and formulae for these purposes.

Reducing Agent. In chemistry, a substance which removes oxygen, chlorine, etc., from compounds. Such substances are hydrogen, carbon, aluminium, etc. The term is used in a wider sense for any substances which bring about conversion into other substances. Some compounds themselves act as reducing agents, e.g. stannous chloride, used in testing for salts of mercury. Sulphurous acid, ferrous sulphate, sodium thiosulphate, and alcohol have also special applications in chemistry as reducing agents. Such agents have to be used when a reaction involving reduction takes place in solution. One of the chief is sulphuretted hydrogen, which reduces ferric salts to ferrous salts, arsenic acid to arsenious acid, chromates to chromic salts, and exerts its action on hypochlorites, nitrates, sulphites, and thiosulphates, with separation of sulphur. In analytical chemistry, the reducing gases of the Bunsen or blowpipe flame, borax, potassium cyanide, etc., are used in dry reactions. *See* Chemistry.

Reductio ad absurdum (Lat., reduction to an absurdity). In logic and mathematics, the demonstration of a proposition by proving the absurdity of that which contradicts it. Thus: two straight lines perpendicular to a third are parallel; if they were not, they would meet, and from the point where they met two perpendiculars to one and the same straight line could be drawn, which is absurd. *See* Logic.

Reduction. In arithmetic, term used for changing the denomination of a quantity without changing its value. Examples are the reduction of pounds, shillings, and pence to pence, or the reduction of separate fractions to a common denominator.

Reduction. In metallurgy, the liberation of a metal from its ore. Thus iron oxide is reduced in the blast furnace to iron. *See* Furnace.

Red Water. Disease which affects cattle at pasture. It occurs mainly from May to Oct., and is more frequent on high land which has never been cultivated. It is known in Scotland as moor ill. The cause of red water (so called from the red colour imparted to the animal's urine) is a minute parasite, similar to that which causes malaria in man, transmitted by a tick. Cattle develop a degree of immunity, but 5 p.c. of victims die. To prevent the disease it is necessary to keep the cattle off the land for two winters and a summer. *See* Cattle.

Red-water Tree (*Erythrophloeum guineense*) or SASSY TREE. Tall evergreen tree of the family

Red-water Tree. Leaves and flower-heads of this West African tree

Leguminosae. It is a native of W. Africa. It has small yellow flowers in terminal clusters. When the tree is cut a red juice flows from the incision. The bark is said to be poisonous, and is used as an "ordeal" by the natives for testing the guilt or innocence of suspected persons. An allied species (*E. laboucherii*) is the Ah-pill of Queensland and other parts of Australia. It has close-grained, hard, red wood—the hardest produced by Australia. The aborigines make woomeras and spearheads from it.

Redwing (*Turdus musicus*). British song-bird. It is related to the thrush, which it greatly resembles in general appearance. It is a winter migrant from N. Europe, and as it feeds almost exclusively on insects, it often suffers great privation in severe weather. Usually found in cultivated areas, it possesses a clear, loud song.

Redwood. Large evergreen tree of California, described under its botanical name of Wellingtonia.

Redwood, HUGH (b. 1883). A British journalist. Born at

Bristol, Feb. 15, 1883, he was educated at the cathedral school, and was a reporter on the Western Daily Press during 1898–1905. From the editorial staff of the Central News agency he went in 1919 to be successively foreign, night, and deputy editor of the Daily News (later News Chronicle), of which in 1934 he became religious editor. Redwood was associated with the evangelising work of the Salvation Army, which he described in God and the Slums, 1930, and was president of its goodwill league.

Ree. A lough or lake of Eire. Formed by the expansion of the river Shannon, it lies between the cos. of Roscommon, Longford, and Westmeath, and contains a number of small islets. It is 17 m. long and from 1 to 7 m. broad.

Reed (*Phragmites communis*). Large perennial herb of the family Gramineae. It is a native of Europe, Asia, Africa, America, and Australia, growing on the margins of lakes, streams, and up wet sea-cliffs. It is of erect growth, the stout, round stems attaining a height of 10 to 15 ft., with broad, flat, rigid leaves. The flowers are gathered in a large, oval, purplish plume. The reed is the predominant plant in the fens of East Anglia, and in the construction of the floating-fens which are found at the mouths of the Danube and in the Black Sea.

Reed In music, the medium by which vibrations are set up in certain organ stops (oboe, tuba, etc.), and in some orchestral instruments, oboe, clarinet, bassoon, saxophone, etc. The former are generally of metal, the latter of a kind of large grass which grows in S. Europe. A beating reed is one in which the edges of the tongue slightly overlap the slotted plate to which it is fastened. In the free reed the tongue passes through the opening. The harmonium

Redwing. Song-bird closely related to the thrush

Reed. *Phragmites communis* growing on the margin of a pool

and American organ are fitted with free reeds, without pipes; in other instruments a pipe enhances the tone and resonance of the organ reed. In the orchestral instruments the tube is essential, the reed being merely the excitatory medium.

Reed. In weaving, a comb-like portion of the loom, consisting of vertical, parallel wires, through the dents or openings of which the warp threads are passed. The reed serves to separate the warp threads, and to beat home the weft, against which its wires are driven by the sley, or oscillator of the loom. *See Loom; Weaving.*

Reed, DOUGLAS (b. 1895). British writer. He was a publisher's office boy at 13, but a sub-editor on *The Times* by 1924; for that newspaper he was assistant Berlin correspondent, 1927-35, then correspondent in Central Europe. Fame came with a trenchant political survey of Europe, *Insanity Fair*, 1938; *Disgrace Abounding*, 1939, and *All Our To-Morrows*, 1942, were equally read. In 1948 appeared *From Smoke to Smother*. Reed, who wrote a play, *Downfall*, 1942, and a novel, *The Next Horizon*, 1945, started in 1946 a weekly, *Tidings*.

Reed, EDWARD TENNYSON (1860-1933). British caricaturist and cartoonist. Born March 27, 1860, the son of Sir E. J. Reed, he was educated at Harrow. In July, 1889, he began to contribute to *Punch*, and was a member of its regular staff 1890-1912. He succeeded Harry Furniss in 1894 as parliamentary caricaturist, illustrating *Essence of Parliament*. Apart from this side of his work, his best remembered drawings were the *Contrasts* series, 1890-91, and *Prehistoric Peeps*, 1893. He died July 12, 1933.

Reed, TALBOT BAINES (1852-93). English typographer and writer of boys' books. Son of Sir Charles Reed, he was born at Hackney, London, April 3, 1852, and educated at the City of London school. In 1868 he joined his father's typefounding business, ultimately becoming managing director. In 1880 he contributed as a serial to *The Boy's Own Paper*, *The Adventures of a Three-Guinea Watch*. There followed other successful books, mainly of school life, e.g. *The Fifth Form at St. Dominic's* (1881), *My Friend Smith* (1882), *The Willoughby Captains* (1883), *Follow My Leader* (1885), *Reginald Cruden* (1885), *A Dog With a Bad Name* (1886), *The*

Master of the Shell (1887), *Sir Ludar*, a historical novel (1889), *Roger Ingleton Minor* (1889), *The Cock House at Fellsgarth* (1891), *Tom, Dick, and Harry* (1892). Reed was an authority on typography, and in 1892 cooperated in founding the Bibliographical Society. In 1887 he published a *History of the Old English Letter Foundries*, and in 1890 edited William Blades's *Pentateuch of Printing*. He died at Highgate Jan. 28, 1893.

Reed, THOMAS GERMAN (1817-88). British entertainer. Born at Bristol, June 27, 1817, he acquired theatrical and musical experience, and during 1838-51 was musical director at the Haymarket Theatre, London. In 1855, with his wife, he started popular dramatic entertainments, where light pieces by Robertson, Burnand, and Gilbert were performed, among his colleagues being John Parry and Corney Grain. Reed was instrumental in bringing Gilbert and Sullivan into partnership. His entertainments, first at the Gallery of Illustration, and later at St. George's Hall, were a feature of London life for a few years after his death at Sheen, March 21, 1888.

Reedbuck. Species of antelope found in Central and S. Africa. It is nearly 3 ft. high at the shoulder, and has pale brown hair on the upper parts with dingy white beneath. The horns are only about 12 ins. long, and rise nearly straight from the forehead, bending slightly forward at the tips. These ante-

T. German Reed, British entertainer

Reedbuck. Female of the antelope formerly common in the Transvaal
W. S. Berridge, F Z S.

lopes were formerly common in the Transvaal, but have now become rather rare. They do not congregate in herds, and are always found in the neighbourhood of water, but never in marshes.

Reed Bunting or **REED SPARROW** (*Emberiza schoeniclus*). Small European bird. Common in most parts of Great Britain, it frequents rivers or swampy ground, where it builds its nest among the reeds or in small trees. It is gregarious in habit, and feeds chiefly on water-plants, insects, and small molluscs. The head and throat of the male are black; the back and wings reddish-brown; the under parts, and a band around the neck, white. The eggs are drab-coloured, streaked with black and dull purple. *See Nest.*

Reed Bunting, on a rush

Reed-mace (*Typha latifolia*), **CAT'S-TAIL** or **CLUB-RUSH**. Tall perennial herb of the family Typhaceae. A native of Europe, N. and W. Asia, N. Africa, and N. America, it grows on the margins of lakes and rivers, and has a short, creeping rootstock from which the round erect stems rise to a height of 7 ft. The broad, nearly flat leaves may be 6 ft. long, with broad bases sheathing the stem. The female flowers are densely packed in a purple-brown spike or "mace" around the upper part of the stem, above which is the yellow "tail" of male flowers. There is a smaller and less common species (*T. angustifolia*) growing in pools and ditches, with narrower leaves and with the male and female spikes separated by a distinct interval of clear stem. It is often, but wrongly, styled bulrush (*q.v.*).

Reed Warbler (*Acrocephalus scirpaceus*). Migrant bird, a member of the family Sylviidae, which includes the chiffchaff, the warblers, and the whitethroats. It is a soberly coloured bird, breeding in reeds. It is locally but

Reed-mace. Leaves and flower spike

fairly evenly distributed throughout S. and midland England between May and Sept. It also breeds in W. Europe, and usually winters in tropical E. Africa.

Reef. Barrier of rock or sand extending along the shore of an island or continent. It is more closely defined by the international geographical congress committee as a submarine elevation which reaches within 11 fathoms of the surface. Such reefs are dangerous to shipping, and the most common are those formed by coral organisms. In mining the word is used for gold-bearing veins of quartz rock. *See* Coral; Coral Reef.

Reefing. Operation of partly furling sail by taking in reefs. Sails have upon them a number of short pieces of rope called reef points. When it is necessary to shorten sail by decreasing the area, these points are knotted around the foot of the sail. A vessel is close-reefed when all possible reefs have been made in her sails. Shaking out a reef is untying one course of reef knots and giving the sail a correspondingly greater area to the wind.

Reef Knot. Knot formed by passing the two ends of one rope through the loop formed by a second rope, whose two ends are similarly passed through a loop in the first. The two parts of one rope are passed above, and of the other below, the loop through which they are inserted. A longitudinal pull tightens the knot, which can be untied only by pushing the loops in opposite directions. One of the simplest forms of knot,

Reef Knot. The knot shown here is used in fastening two ropes together

this was used for securing the shortened canvas when reducing or reefing the area of a sail.

Reel. Mechanism for winding yarn into hanks. A simple form consists of a skeleton hexagonal revolving frame over the arms of which the yarn is wound from bobbins or other holders. A hand warp-reel measures lengths of yarns for testing purposes, and an indicator carried upon the apparatus indicates the length wound. Power-driven reels used in manufacturing operations are made long enough to wind a number of hanks simultaneously. By imparting a reciprocating motion to the skele-

ton frame on which the hanks are wound the yarn can be laid in diagonals instead of in plain circles. Yarn so reeled is called cross-reeled, and cannot be unwound by hand like the ordinary straight reeling used with hand-knitting wools. *See* Spinning.

Reel. Scottish national dance. It is performed by two or more couples, and called accordingly a foursome, sixsome, or eightsome reel. The music is provided by the bagpipes or fiddle; wanting these, the dancers sing their accompani-

Reefing. First reef taken in the fore-and-aft sail of a cutter or yawl

ment. It is a circular dance with quick, gliding movements, involving much whirling and a graceful forming of the figure eight, but it varies in different parts of the country. *See* Dancing.

Reeve (A.S. *geréfa*). Term applied to various public and private officials in England, chiefly in the Middle Ages. From Anglo-Saxon times the reeve was the steward or bailiff of an estate, who maintained order, collected dues, and supervised labour. Such was the reeve in Chaucer's *Canterbury Tales*. The word and office survive in the Scottish grieve. Dyke-reeves and field-reeves had special functions. In some coal mines a foreman or overseer is still called a reeve. Land confiscated by the crown was called reeve-land.

The word was also used of persons invested with certain public, especially magisterial, functions, as the sheriff (*q.v.*) or shire-reeve, the port-reeve (*q.v.*), and the borough-reeve. The manor-reeve was the elected representative of the villeins. The town-reeve was one of the four representatives of a town in the hundred court or shire court. In Canada the title reeve is given to the president of a town or village council.

The word reeve is probably unconnected with German *graf*, a count. Other words identical in form are reeve, the female of the ruff (*q.v.*), and the nautical term to reeve (a rope), to pass it through a ring or hole.

Reeve, HENRY (1813-95). British journalist and author. Born at Norwich, Sept. 9, 1813, he was educated at the grammar school there. He spent some time in travel on the Continent, and in 1837 secured an appointment under the privy council. Three years later he joined *The Times*, writing for it on foreign affairs, with wide knowledge especially of France and leading Frenchmen. In 1855 he became editor of *The Edinburgh Review*, holding that position together with that of registrar of the privy council, to which he had been appointed in 1843. He died Oct. 21, 1895. Reeve is best known as the editor of the *Memoirs of Charles Greville*, his predecessor at the privy council. He also wrote *Royal and Republican France, 1872. Consult* *Memoirs and Letters, J. K. Laughton, 1898; Letters of Charles Greville and H. R., ed. A. H. Johnson, 1924.*

Reeves, JOHN SIMS (1818-1900). British tenor singer. Born at Wool-

wich, Sept. 26, 1818, he sang the baritone part of Rudolph in *La Sonnambula* at Newcastle-upon-Tyne, 1839, and joined Macready's Drury Lane company as tenor, 1841. Having

J. Sims Reeves, British singer

studied abroad, he sang in opera in London in 1847, and then entered upon his long career as an oratorio singer, continuing to perform with outstanding success until his farewell appearance in 1891. Sims Reeves, also famed as a ballad singer, died at Worthing, Oct. 25, 1900. His *Life and Recollections* was issued in 1898, and a biography by C. Pearce in 1924.

Re-exports. Goods imported into a country and then exported. These are classified separately in the Board of Trade Journal. If import duty was paid when the goods were imported, it is normally repayable when they are re-exported. Often, however, goods imported for re-export are stored in bonded warehouses, and no duty is then payable. Such bonded warehouses take the place

in the U.K. of free ports and free districts elsewhere. The term entrepot trade is sometimes applied to the business of importing for re-export.

Refectory (Lat. *refectorium*, from *reficere*, to restore). Large hall in an abbey or kindred group of monastic buildings, where the monks or nuns took their meals. It was often a detached building, but sometimes was incorporated in the general ground-floor plan, being situated as a rule between the kitchen and the other offices of the establishment. See Abbey; Monastery.

Referee. One to whom any matter or question is referred for decision. The term is applied in several connexions. In law it may mean an official referee, who is an officer of the court. The matters generally referred to him by a court are those involving prolonged investigation of documents or some scientific or local investigation. A court is also empowered to refer specific matters to some specially qualified person as a referee. In general sports a referee is the official who controls the game or contest while it is in progress. See Arbitration; Boxing; Football; Umpire.

Referee, THE. Former London Sunday newspaper, which first appeared on Aug. 19, 1877. Henry Sampson (1841-91) was proprietor and first editor, and his pen-name of Pendragon led other contributors to take pseudonyms from Arthurian legend. G. R. Sims (1847-1922), as Dagonet, contributed the humorous feature Mustard and Cress from the start, and sport and drama were well covered. In 1931 the paper was renamed The Sunday Referee. Isidore Ostrer (*q.v.*) was proprietor from that year, with R. J. Minney editor from 1935. While the lighter features were still prominent, regular writers included Aldous Huxley, Bertrand Russell, Edith and Osbert Sitwell, and H. G. Wells. In 1939, when the circulation had reached nearly half a million, the paper was sold to Lord Kemsley and merged in The Sunday Chronicle.

Referendum. Direct appeal by a government or legislature to the electorate to ascertain their vote on a specific matter, *e.g.* prohibition or women's suffrage. The referendum has been widely used in Australia, where since 1901 some 25 issues have been submitted thereby to voters, all involving a change in the constitution, *i.e.* the transfer of certain powers from the

individual states to the federal government. Some written constitutions provide for the referendum when it may be desirable to revise the constitution. In Eire a referendum can be taken on any measure passed by the Dail if it is requested by one-fifth of the senate or one-twentieth of the electorate. Most states of the U.S.A. use the referendum for proposed amendments to their constitution. In the U.K., where the powers of parliament are not limited, the idea has met with little support.

Refinery. In metallurgy, a plant in which metals are purified by removing some or all of the unwanted matter present in the raw material. All metallurgical operations are refining processes, after the initial concentration of the ore. The term is, however, usually reserved for the final operation of improving the crude metal from the smelter until it has become pure. In some instances no refining of the metal first produced in the smelter is needed, particularly if the chief impurities are not harmful. For example, it is unnecessary to use super-purity zinc and electrolytic copper to make common brass, when spelter and blister copper are sufficiently pure. But small amounts of impurities often widely influence the properties of metals and alloys, and the tendency is to demand increasing purity, which necessitates bigger and more effective refineries. Commercial aluminium exceeds 99.5 p.c. aluminium, but this is unsuitable for some purposes and must be refined to more than 99.95 p.c. Small amounts of impurity have a deleterious effect on the conductivity of copper, and oxygen-free high conductivity copper normally exceeds 99.95 p.c., and good fire-refined copper is similarly pure. It is possible if needed to produce copper exceeding 99.999 p.c., and electrolytically refined gold or silver may exceed 99.95 parts per thousand. By special processes small amounts of most metals may be produced at extreme purities of the order of 99.99 to 99.999 p.c. or more; but these are not usual on the commercial scale. The layout of any refinery depends entirely on the processes to be used, which may be chemical, electrolytic, pyrometallurgical, or combinations of these and other processes.

Similarly, in oil technology, a refinery is a plant where crude oil is purified. In a petroleum refinery the oil is split into fractions,

which are purified or refined and, if necessary, blended. The temperature of the crude oil entering the refinery is raised by passing it through heat exchangers, from which it goes to a fractionating column. It is not usual to complete fractionation in one operation, gasolene, kerosine, and gas oil being taken off in the first column. The residue is reheated and sent to a second column, at reduced pressure, where lubricating oil distillates and either asphaltic bitumen or waxy residual lubricants, are obtained. Various distillates and residues are sent direct to the cracking plant to increase the yield of gasolene and improve the quality of that already obtained.

Refining of gasolene removes or converts mercaptans and other objectionable sulphur compounds, and it involves either washing with strong sulphuric acid, followed by soda and water washes, or treatment with sodium plumbite, which converts mercaptans to disulphides. Sulphuric acid also removes substances which discolour the gasolene and cause gummy deposits to form in engines. Kerosine is refined by sulphuric acid wash and aromatics are extracted from it by liquid sulphur dioxide. Lubricating oils are treated with liquid propane to precipitate asphalt, then with solvents such as phenol and furfural to remove various gummy and aromatic compounds, and finally with acetone and benzol to remove wax. Certain special products such as transformer oils, medicinal oils, etc., need refining with fuming sulphuric acid.

Gases from the cracking plant are separated into their components by fractionating columns and are then used in various polymerisation and alkylation processes for the synthesis of gasolene. They are also the raw materials for the manufacture of a wide range of organic substances including synthetic rubber and plastics. Control of the main refining operations is largely automatic and is effected from a central control room.

Reflection (Lat. *reflectere*, to bend back). In physics, general phenomenon occurring in all kinds of wave motion. It is most noticeable in light. If a beam of light be reduced to a theoretical ray it is reflected in one direction, and it is said to undergo regular reflection. The point where a ray of light strikes the reflecting surface is the point of incidence. A perpendicular to the reflecting surface through this point is called the normal; the

angle the incident ray makes with this normal is the angle of incidence; the angle the reflected ray makes with it is the angle of reflection. The laws of regular reflection from a square are as follows: (1) The incident ray, the normal to the surface, and the reflected ray are all in the same plane. (2) The angle of reflection is equal to the angle of incidence. Without the phenomenon of reflection

Reflection. Diagram showing law of reflection. Ray of light ABC makes equal angles ABD, CBE with the perpendicular to the reflecting plane BE.

bodies not luminous in themselves would be invisible. If the reflecting surface is not smooth the incident radiation suffers diffused reflection over a wide range of angles.

The reflection of light and radiant heat is an important factor in the physics of the atmosphere. For example, a large proportion of the light which comes from the sun is reflected by clouds; a cloud will return 78 p.c. of the incident radiation, and the amount of reflection is virtually independent of the angle of incidence. See Light; Optics; Refraction.

Reflex Action. Muscular action which is the result of an afferent impulse, i.e. an impulse originating in a stimulus external to the body and conveyed by a nerve to a part of the central nervous system, which then sets in motion the muscles necessary to produce the action. For instance, if the skin be pricked or touched with something hot, an impulse is carried by the nerve which has been stimulated to a nerve centre, and from this another impulse is sent down to the appropriate muscles, causing them to withdraw the limb from the source of pain.

Other instances of reflex action are the watering of the eye and the movements of the eyelids when a speck of dust enters the eye; the contraction of the pupil when a strong light falls upon it; and the pouring out of saliva or watering of the mouth which occurs at the smell or sight of food. A true reflex action is independent of the will and may occur in states of unconsciousness, as, for instance, the drawing away of the leg if the sole of a sleeping person be tickled. Nerve centres through which reflex

actions are carried out exist in the brain, the spinal cord, and the sympathetic nervous system. See Brain; Nervous System.

Reform Acts. In British history, name given to the series of Acts reforming parliamentary franchise and the composition of parliament, and designed to secure an adequate expression of the popular will in government. The formal title of these Acts is the Representation of the People Acts (*q.v.*). The most famous Reform Act is that of 1832.

For years before the introduction of Russell's first bill in 1831, a growing movement had demanded drastic parliamentary reform. The notorious constituency of Old Sarum returned two members for its heap of ruins; Manchester and Birmingham, with rapidly increasing industrial populations, were unrepresented. Russell's first bill was dropped, reintroduced, and rejected by the lords, Sept. 21. In Dec. he introduced a new bill which passed the commons in March, 1832, but was rejected by the lords on May 7. Grey and his cabinet resigned, and public feeling against the wreckers of the expected reforms ran high. Backed by the king's assurance of the creation of new peers to ensure passage, the Whigs resumed power and the bill became law on June 7. The county franchise was given to occupants of lands and tenements at annual rent of not less than £50, the borough franchise to occupants of houses or shops of £10 yearly

Reflex Action. A familiar example. The foot is drawn away if the sole is tickled; a sensory stimulus passes to a centre in the spinal cord, whence motor impulses are sent out to muscles that carry out the action. This occurs apart from any intention, but may be controlled by the brain, though the conscious prevention of the action may be impossible.

value. Fifty-six English boroughs were disfranchised, 30 had their membership reduced to one; 22 boroughs were created with two members each, and 20 with one member each.

Abortive attempts at further reforms were made by Russell, 1854; Disraeli, 1859; Palmerston, 1860; Gladstone, 1866. But in 1867

Disraeli carried through the second Reform Bill. Borough franchise was extended to all householders rated for poor relief, and to lodgers occupying lodgings of annual value £10; the county vote to persons holding leasehold and copyhold of £5, and to occupiers of £12 rateable value. This increased the electorate from 1,353,000 to 2,243,000. Redistributions were also effected, and supplementary Acts for Scotland and Ireland were passed in 1868.

Gladstone's, or the third, Reform Act was passed in 1884, followed by a Redistribution of Seats Act in 1885. This measure added some 2½ millions to the register. It made uniform the householder and lodger franchise throughout the U.K., created 33 new boroughs, increased the representation of several large centres, and gave Scotland 12 additional seats.

In 1918 another Reform Act was passed into law. This increased the electorate by some 8,000,000, and admitted a measure of woman suffrage to the extent of about 6,000,000. The franchise was given to men over 18 who had served in the forces, to all other men over 21 years with a six months' residence qualification, and to women over 30 who were either local government electors or the wives of such electors. No elector could vote for more than two constituencies, and all general election polls were to be held on the same day. The redistribution of seats added 31 to England, and two each to Scotland, Ireland, and Wales, university representation (with a system of proportional representation) being increased to 15. The total electorate of the British Isles was thus brought to over 21,500,000.

In 1928 an Act allowed all women over 21 to vote, and the number of electors was increased to about 27,000,000. The Representation of the People Act,

1945, reduced plural voting by abolishing the qualification (introduced in 1928) of a husband or wife in respect of business premises occupied by the spouse; and that of 1948 abolished all forms of plural voting and the university franchise, and enacted a complete redistribution (*q.v.*) of seats. See Commons, House of.

THE REFORMATION AND ITS EFFECTS

A. D. Innes, M.A., Author, *Cranmer and the English Reformation*

In addition to the companion article on the Renaissance, those on Calvinism: Lutheranism; Papacy; and Protestantism may be consulted; also the biographies of Calvin; Hus; Knox; Luther; Wycliffe, and other Reformers. See also England; Germany; Scotland, and other historical accounts; also Huguenots; Indulgence

The Reformation is the name given to the great religious revolution or reconstruction of Western Christendom which took place during the 16th century, issuing in the division of all Christendom into three sections: the self-styled "Orthodox" or Greek Church of the East, which had already, for many centuries, been parted from the West; the self-styled Catholic Church of Rome, acknowledging the supreme authority of the papacy; and thirdly, the whole group of Christian bodies which, whether they claimed or did not claim for themselves the title of Catholic, all stood outside both the Greek and the Roman Churches. These, being in agreement at least on the one point of repudiating the papal authority, presently received the common designation of "Protestant," although that term in its primary significance embraced only the adherents of one particular confession. The latter bodies claimed for themselves individually the name of Reformed Churches.

State of the Medieval Church

Periodically, during the Middle Ages, there was a demand for reformation; but that meant, not a revision of Christian beliefs, but reformation within the Church, the ecclesiastical body, reformation of system, of morals, of methods. Revision of claims to authority, and proposals for revision of doctrine were vigorously suppressed. Such demands were raised, not only by the laity, but among the clergy themselves. The distinctive feature of the 16th century Reformation was its insistence upon a revision of doctrine, which involved not merely reformation but reconstruction, a complete change in the relations of clergy and laity, which had not been contemplated by earlier reforming movements.

In the medieval Church, disciplinary movements had been for the most part of ecclesiastical origin, but such came in waves. The last had exhausted itself by the beginning of the 14th century. From that time various causes combined to set ecclesiastical authorities in antagonism to reforming movements. The long captivity of the papacy at Avignon shattered the ideal of Gregory VII and the great popes of the 12th and 13th centuries. An even

deadlier blow was dealt to the spiritual character of the papacy by the Great Schism. The slight and partial recovery which followed the council of Constance was itself followed by the appalling relapse, which culminated with the pontificate of Alexander VI. The need for reform at the close of the 15th century was making itself universally felt, and a vigorous reforming movement was actively at work; but it had not yet reached the supreme authority.

Spiritual and Secular Rivalry

The spiritual authority, therefore, had been without a spiritual reality for generations. To the people it had proffered not living faith, but dead formulas, not an inward religion, but outward observance; not worship of the Divine, but cultivation of the Divine favour through the medium of purchasable clerical favour; with the natural consequence that respect for the Church was at a very low ebb.

Other forces also were at work. Politically there was an immemorial rivalry between the authority of the Church and the authority of secular princes; secular princes were generally willing to resent papal assertions of authority which challenged their own, and to assert their authority over clerics in their own dominions in despite of ecclesiastical thunders. The vast accumulations of wealth in the hands of prelates and ecclesiastical bodies were a constant grievance of the laity. The clergy were by profession guardians of morality; their lapses from morality were therefore condemned with all the greater severity. Moreover, it was palpable that the clergy in the higher ranks concerned themselves at least as much with politics and essentially worldly affairs as with their pastoral functions.

There was nothing novel or unprecedented about these conditions. But in the past the ecclesiastical claims to authority had been most resolutely asserted in days when the ecclesiastical champions were conspicuously great men, or at least men with great ideals; whereas at the beginning of the 16th century the Church had reached its nadir. It was at its worst in respect of everything that had ever excited against it the denunciations of moralists and the

jealousy of lay magnates, while in addition to all this, the obscurantism which had once been in some sort a source of strength had become a cause of weakness.

The revival of letters was making it impossible to accept the limitations which the Church had imposed upon legitimate inquiry; and the inference that the Church's pronouncements, instead of being infallible, were born sometimes of ignorance, and sometimes of a fear of truth, was becoming irresistible.

The actual occasion of revolution was the action on the part of Leo X which roused Luther to challenge the papacy. That challenge raised the whole question of authority in the most acute form. The whole position of the medieval Church rested on the assumption that the Church was the Divinely appointed intermediary between God and man. The whole Lutheran or Protestant position assumes direct personal relations between God and the individual man.

Lutheranism undertook to challenge doctrines which were generally accepted, ostensibly on the ground that they were in contradiction to the teaching of Scripture; in fact they were in the main precisely the doctrines which involved the recognition of the priesthood as a necessary channel of grace. The challenge, therefore, however sincerely inspired by enthusiasm for truth and righteousness, was in effect anti-papal and anti-clerical; and therefore it attached to itself, or allied itself with, all the anti-papal and anti-clerical elements, which in themselves had no concern at all with doctrine.

Right of Private Judgement

The logical outcome of the Protestant position was the assertion of the right of private judgement; but that was not in theory the claim which Protestantism made. In theory it repudiated the authority of the Church, but substituted for it the authority of Scripture. Its weakness lay in this, that Scripture needs interpretation; and Protestantism provided no infallible interpreter. Protestantism, therefore, inevitably broke up into sects, each group offering its own interpretation, and pronouncing all antagonistic interpretation to be false and anti-Scriptural. In a world accustomed for centuries to recognize a single indisputable or unquestionable authority, the recognition of the right of private judgement appeared simply to spell chaos. Whatever might be the case in theory, Protestantism was in practice driven back upon the position that the state was the arbiter. Every state

of necessity sought to establish its own form of Church, whether the Church so established remained a part of the Roman organization or not; and each state claimed at its own will to prohibit or concede a limited toleration to other forms of Church government, doctrines, and observances. The broad line of demarcation was that between the states which in popular language were described as Catholic and Protestant, the states whose governments continued to recognize, and those which repudiated, the authority of the Church of Rome.

Revolt of Luther and Wycliffe

As the epoch of the Reformation is said to open in 1517 with Luther's decisive challenge to the papacy, so it is to be reckoned as closing with the dissolution, in 1563, of the council of Trent, which definitively established the limits of Roman Catholicism. Luther was the champion of revolt against the doctrinal authority of Rome, and his distinction is that he was the first to head a revolt which succeeded. The seed which came to harvest in the 16th century had been sown in the 14th by John Wycliffe in England. After Wycliffe's death his doctrines were stringently suppressed in England, though the persistence of concealed Lollardy kept the soil in some degree of readiness for further developments. Moreover, the doctrines that were taught at Oxford found their way to the university of Prague, where with some modification they were adopted by John Hus (*q.v.*). There were other universities besides Prague where the teachings of Hus were germinating a hundred years after his death.

The revolution which Luther initiated followed varying lines of development in the various countries of Europe during the 46 years which we have called the epoch of the Reformation. By the end of that time Spain and Italy were secured for the papacy; England, Scotland, and Scandinavia were secured for Protestantism; in France it was still uncertain whether Catholics and Protestants would settle down to mutual toleration, the Huguenots being in a minority, but still far too strong to be easily crushed by force. The crowd of German states were severally recognized as Catholic or Protestant, according to the predilections of their rulers; even the ecclesiastical principalities were not all given to the Catholics.

But in the main and speaking roughly, Protestant states predominated in north Germany and Catholic in the south. In Poland,

Bohemia, and Hungary it was still uncertain which of the creeds would conquer in the end. The Protestant folk of the northern Netherlands were still under the yoke of Spain.

We may turn now to the narrative, beginning with Germany, where the gage of battle was definitely flung down.

In 1517 Pope Leo X, in want of money, proposed to procure supplies by the sale of indulgences on a scale and at a price hitherto without precedent. The sale of indulgences was not a new thing; it had before been made the subject of protest, but the scruples of princes had been quieted by a percentage of the profits.

But Luther had come very definitely to the conclusion that neither priests nor popes could grant pardons, the forgiveness of sins being the function of God alone. He posted on the church door at Wittenberg a series of theses denouncing the doctrine of indulgences, and the Elector of Saxony supported him by refusing permission to the commissioners for the sale of indulgences to enter Saxony. Luther now set about the hopeless task of fortifying his position so as to make his argument convincing to those who were certain not to be convinced; in so doing, he found himself proving to himself that reconciliation was impossible, and in effect prepared himself, not for the defence of a particular thesis, but for open war.

Position of the Protestants

At the diet of Worms he clearly proclaimed the Protestant position: that popes and councils may err, but the truth which he found in Scripture could not err, and by that he would stand at all costs. That declaration was in fact the assertion of his own right and his own duty to follow his own judgement and to obey his own conscience. If that was his right and his duty, it follows that it is no less the right and duty of every individual. The logical conclusion was universal toleration for all opinions conscientiously held, but Protestantism did not for generations to come rise to the fullness of that conception.

Germany was divided in opinion. Personal interests, contempt for the papacy, anti-clerical sentiment, admiration for Luther's courage, genuine moral and religious enthusiasm, all combined in varying degrees to bring together a body of support for Luther so powerful that any attempt to crush it would obviously have involved Germany in civil war, of which no one could have foretold the issue. The edict

issued against him by the diet became practically a dead letter. A diet held at Spire in 1526 agreed upon a compromise, which virtually left each of the princes to settle matters as he chose within his own dominion; when another diet there, 1529, cancelled the compromise and resuscitated the edict of Worms, the new edict was met by the Lutherans with a defiant protest which gave to them and to the cause of the Reformation the name of Protestant: and this was followed up by the issuing of the formal confession of faith in 1530, known as the Confession of Augsburg (*q.v.*). But this was not enough, and the princes who adopted the Augsburg Confession united themselves in the defensive armed league of Schmalkalden.

The Council of Trent

The predilections of Charles V (*q.v.*) were antagonistic to Protestantism as being subversive of authority in general, and a palpable obstacle to one of his great political aims, the establishment of the emperor's personal authority in the empire as supreme. But Charles could not afford to plunge into a doubtful civil war, and the years passed uneasily, with civil war perpetually threatening. The prevalent view, which everyone professed more or less ardently to support, was that the whole question ought to be dealt with and brought to a final settlement by a general council of the Church.

But unfortunately every party concerned wanted such a council to be held under conditions which would ensure that particular party's own predominance therein, and by no means under conditions which promised the predominance to someone else. Pending the summoning of a council, a conference was held at Ratisbon between representatives of the various religious parties, in 1541, but no basis of agreement was reached. At last, under pressure from the emperor, Pope Paul III summoned a council to be held at Trent in 1545, but the terms under which it assembled made it a foregone conclusion that its decisions would be wholly papalist; practically Protestants declined to recognize its oecumenical character. Its decisive activities were deferred till 1562.

Meanwhile in Germany the contest had reached a settlement on its political side, for Luther had done much to avert an armed conflict. Almost immediately after his death in 1546 Charles found an opportunity for attacking and crushing the league of Schmalkalden (*q.v.*). In 1547 his personal relations with the pope were

exceedingly strained; therefore he took matters into his own hands, and issued on his own authority the terms of a compromise known as the interim of Augsburg, which was satisfactory to no one. A reaction set in, and in 1552 the emperor without warning found himself almost deprived of authority, and was obliged to submit to the treaty of Passau, which in 1555 was confirmed by the pacification of Augsburg, intended to establish a permanent religious peace throughout Germany, having as its basis the principles that the religion in each state should be the religion of its prince, and that toleration should be granted to the Lutheran worship. For various reasons the settlement did not prove permanent, but it secured peace for more than 60 years.

Reformation in Switzerland

In Germany the struggle had practically been one between the adherents of the Lutheran confession and the adherents of the papal authority on questions of religion. But it had been bound up with a constitutional resistance to the emperor's political design for centralising the control of the empire by establishing his own supremacy. It had been further complicated by the traditional antagonism between pope and emperor as to the spheres of their respective authorities. Only latterly it was touched also by a non-Lutheran form of Protestantism which predominated outside of Germany. The fountain-head of this other form of Protestantism was in Switzerland. The Swiss school predominated in France, in the Netherlands, and in Scotland. In England the Reformation was a peculiar and distinctive compromise in which the dominating factors were political.

The Swiss reformation was set in motion by Zwingli, at Zürich. Zwingli, like Luther, successfully challenged the doctrine of indulgences and the attempt to sell them. Like Luther, he attacked abuses, and made the Scriptures the criterion of truth. But his interpretations of Scripture were not identical with those of Luther; on the question of the Eucharist the two held fundamentally divergent views. Luther, rejecting the Roman doctrine of transubstantiation, substituted for it the doctrine of consubstantiation, affirming the real presence, though in another form. Zwingli denied the real presence altogether, claiming that the Lord's Supper was purely commemorative. Zwingli was tolerant, willing to recognize as legitimate much wider diversi-

ties of opinion than Luther, who denounced him almost as energetically as he denounced the pope.

Reforming refugees from other countries sought asylum in Switzerland. Among these was John Calvin, who, in 1536, issued from Basel the Institutes, which at once laid down the doctrines of the Calvinistic theology, and the principles of the form of Church government known as Presbyterianism. Calvin, without accepting consubstantiation, admitted in his doctrine of the Eucharist a more mystical view than the frank rationalism of Zwingli. But he was still further removed than was Luther from the Zwinglian attitude of toleration; his creed was more rigid than that of either Zwingli or Luther, and more completely irreconcilable with mere modifications of Roman doctrines, or the Roman organization.

When Luther defied the papacy, Lutheran and Zwinglian doctrines at once began to make way in other countries, though the secular authorities were generally disposed to suppress them with more or less vigour. Jealousy of the clergy, however, was common among the nobility. In France the crown, after a brief hesitation, definitely took the side of orthodoxy against innovation. But many of the nobility followed the opposite course; they derived, moreover, a certain strength from the obvious fact that Francis, despite his title of the Most Christian king, was quite ready to ally himself with heretics, or even with infidels, if by doing so he could serve his own political purposes. Then Calvinism, originated by a Frenchman, appealed to the French mind. Calvinism lent itself to political organization, and the Huguenots, as the French reformers were called, became a very powerful body.

Growth of Political Parties

The adherents of the rival faiths assumed the character of political parties. The Catholics themselves were largely anti-papal in the days of the council of Trent, at least in the sense of claiming a great degree of national independence; and though Catholicism was definitely predominant, it by no means held a decisive mastery. For 35 years to come there was a continuous struggle, which was only brought to a conclusion when the legitimate Huguenot claimant of the crown purchased Catholic support by renouncing his Protestantism, but kept faith with his former co-religionists by issuing the edict of Nantes in 1598.

In Scotland the movement, which, as in France, drew its inspiration from Geneva, was vigorous among the commons. The crown, closely allied to the Church in its struggle with the nobles, encouraged persecution; the nobles, angrily hostile towards the churchmen, leaned strongly to the side of the Reformation, and finally won a complete victory with the aid of Queen Elizabeth in 1560. In the Northern Netherlands Calvinism took a firm grip in spite of the persecuting policy of Charles V and his successor, Philip II of Spain; but the great struggle of those provinces for religious liberty was still to come.

Henry VIII and England

In England, before the appearance of Luther in Germany, a reforming movement had already made great progress under the guidance of scholars and humanists, not without encouragement from leading ecclesiastics, all acutely conscious of the need of raising the moral and intellectual standards, both of clergy and laity. But the Lutheran propaganda, and the anarchist propaganda, by which, in spite of Luther's own denunciations, it was accompanied, made reactionaries of the reforming leaders themselves. There was among most of them no disposition to question the spiritual authority of the Church, or of the papacy, no thought of challenging received doctrines, though much demand for the abolition of obviously corrupt customs. But circumstances developed in the mind of Henry VIII a determination to repudiate the authority of the papacy, because he found that it stood in the way of his personal desires. Since the pope was not to be persuaded to annul his marriage with Catherine of Aragon, the pope was to be penalised by the unqualified refusal to recognize in England any papal authority whatever, and by the cutting off of all English contributions to the papal coffers.

The English clergy were not disinclined to claim national independence of the Roman episcopate. Having failed to take their stand on the side of ecclesiastical against secular authority, they found themselves powerless to resist the king when he went on to assert his own personal supremacy as head of the Church in England, or when he proceeded, with the assent of parliament, to enormous confiscations of ecclesiastical property, and the complete suppression of monastic establishments. In all this the king had the support of every anti-clerical element in the

country; and since not a few of his most useful instruments were men with leanings towards Lutheran or Zwinglian doctrines, and the friendship of German Lutherans was for political reasons desirable, the king, without admitting such doctrines, was willing to suffer some small latitude of opinion, but nothing more.

During the brief reign of Edward VI, the government gave free play to the reformers; by vigorous ecclesiastical legislation it imposed religious formulas, Protestant in character, and definitely ranged itself upon the side of Protestantism; though the dominating influences gave the formulas an extremely comprehensive character, sufficiently indefinite to cover very wide diversities of opinion. In the next reign Mary endeavoured to recall the country to its old allegiance to Rome. She defeated her own ends by resorting to the fatal method of persecution. The legitimacy of her half-sister and successor Elizabeth could be maintained only on the hypothesis that the papal pronouncement on the so-called divorce of Catherine of Aragon was invalid. Elizabeth therefore was compelled to repudiate the papal authority, and it had already become clear that such repudiation was incompatible with the retention by the Church of those Roman tenets which the various Protestant schools had agreed in rejecting. The popular hostility to Rome, confirmed and greatly extended by the Marian persecution, weighed in the same scale; and with the accession of Elizabeth England was definitely ranged on the Protestant side.

Reformatory. Former name of schools for the reform of young delinquents aged 14 years and upwards, and for the reception and training of others who seemed likely on account of their circumstances to become delinquents. Reformatories for children under 14 were called industrial schools.

Reformatories and industrial schools were instituted by philanthropic individuals and societies with the dual object of preventing "hordes of unruly children" from becoming a danger to the community, and of fitting them for industry by controlling them strictly in institutions and training them to earn their own living. The Philanthropic society in 1788 established a school in London for the children of convicts; John Pounds opened the first ragged school in 1818. Rich people started small feeding schools in the large cities; then opened ragged schools in which the children could be housed and cared for and trained; and bought land and built industrial schools for the younger children and reformatories for the older children who had been convicted of crime and would otherwise have been sent to prison. The institution set up by the Philanthropic society at Redhill in 1839 to replace its London school became the pattern for many others.

In 1854 the Reformatory Schools Act was passed, and was followed by the Industrial Schools Act in 1857. These Acts authorised government grants to such schools and made the home secretary responsible for their inspection. In 1858 there were 45 reformatories in England and Scotland containing 1,973 boys and 370 girls—only about 200 of them detained by magistrates' orders. In 1914 there were 223 schools with 25,000 children.

The Children Act of 1908 clarified the law for the protection of children. A children's branch of the home office was established. One of its reports, 1927, led to the Children and Young Persons Act of 1933, by which industrial schools and reformatories were renamed approved schools, *i.e.* approved by the home secretary for the reception and training of children (those who appear to be less than 14 years of age) and young persons (those who appear to be 14 to 17). Boys' approved schools are classified into junior, intermediate, and senior, and girls' schools into junior and senior. The schools vary according to religious denomination, size, character of buildings, vocational bias, etc. The time required for completion of training varies according to the needs of the pupil, and a court does not specify any period of detention. But a child may not be detained longer than 3 years, or 4 months after school leaving age; a young person under 16 for more

than 3 years; and a young person over 16 after his 19th birthday. At certain short-term schools 9-12 months training is given. In 1950 there were in England and Wales 92 boys' approved schools (with 7,834 pupils) and 43 girls' schools (with 1,386). *Consult* Making Citizens, M. M. Simmons, 1948.

Reform Club. London club. It was founded in 1836, and was long the chief club of the Liberal party. The house, 104, Pall Mall, was built by Sir Charles Barry. As a political centre it was superseded by the National Liberal Club (*q.v.*), but it remained a meeting place especially for lawyers, economists, and journalists. The Manchester Reform Club, founded in 1866, was an important centre of Liberalism in the north of England.

Reformed Churches. Term used generally for all Protestant bodies which have separated from the Church of Rome and adopted the principles of the Reformation. It is more definitely applied to denominations in Germany and elsewhere, which separated from the Lutherans and followed the teaching and church organization of Calvin and Zwingli. They are strongly predestinarian in doctrine, reject Luther's theory of consubstantiation in the Eucharist, are presbyterian in church government, and adopt a simple and extemporaneous form of public worship. In Germany they are often called Evangelical Churches.

Reformed Episcopal Church. Small Protestant denomination, originating in a secession from the Episcopal Church of America. It originated in 1873, when Bishop Cummins and seven other clergymen left the American Church on the ground that it was not sufficiently Protestant to meet their views. They objected to the doctrines of the real presence, baptismal regeneration, the eucharistic sacrifice, the power of the priesthood, and the necessity for episcopal ordination. Cummins consecrated other bishops, and a few local churches were started. The movement found some adherents in England, where it is called the Free Church of England with some 50 places of worship.

Refraction. In optics, a phenomenon caused when waves of light or other types of wave-motion pass from one medium into another medium. Usually when light waves traverse two media, the waves have their directions changed or refracted. The phenomenon is of importance in atmos-

pheric optics, for it is due to refraction that mirages, haloes, and rainbows occur, that the day appears longer than it is, etc. When the stratification of air is such that there are rapid changes of density with height, the sun may appear distorted and can even vanish without apparently reaching the horizon. A

Refraction. Diagram showing the law of refraction. See text

common example of the effect of refraction is seen when a walking-stick is partly submerged in water. The stick appears to be broken at the surface of the water, due to the different indices of refraction of air and water. In the figure, A B is a ray of light refracted at B along the line B C. B D is the plane between the two media, and E B F the perpendicular at that plane. By the laws of refraction the refracted ray makes with the normal an angle whose trigonometrical sine bears a constant ratio, for any two particular media, to the sine of the angle the incident ray makes with the normal. When light is refracted from one medium to another, the ratio of the sines of the angles of incidence and refraction is known as the refractive index. Certain crystals are remarkable for their power of giving two refracted rays, i.e. double refraction. See Crystallography; Light; Optics.

Refractometer. Instrument which assumes various forms for

Refractometer. Diagram of Pulfrich instrument. See text

determining the refractive index of solids, liquids, or gases.

In a Pulfrich refractometer for determining the refractive index of liquids, of which only a small quantity is available, the principle of total reflection is used. The figure shows diagrammatically the principle of such a refractometer. A is a Geissler tube and the source of light, concentrated by lenses in B on to a glass cylinder C, which

contains a liquid whose refractive index is being tested. D is a prism, a and b refracted ray, $b c d$ angle read by telescope E, mounted on a graduated circular scale F; e is a shadow area to left of ray, f bright area to right. Calculation of angle $b c d$ gives refractive index. In an interference refractometer, the index is determined by the use of interference fringes, and so allows of the measurement of the difference of path of two interfering rays. The instrument may be used in various forms to measure very minute linear distances where great accuracy is required. One such is the Rayleigh refractometer for measuring the small refractive indices of gases. To increase its accuracy the tubes containing the gases are 12-18 ins. long.

Refractory Material. Term meaning any material which is stubborn or difficult to work or treat. Certain metals, e.g. tungsten, molybdenum, zirconium, iridium, are termed refractory, because they are extremely difficult to work or fabricate even at very high temps. Processes have, however, been devised for making these metals into crucibles, tools, etc., where their very refractoriness is of value. In metallurgy, a refractory material is one which will withstand the very high temps. and hard conditions in a furnace; such refractories are used to make bricks for furnace and kiln linings, crucibles, flues, chequer-work for regenerators, etc. They must withstand not only high temps., but also the action of slags, high pressures, and weights, erosion by hard particles, corrosion by gases and liquids, oxidising and reducing conditions, penetration by gases or liquids, and rapid changes of temp. No one material will withstand all possible conditions, and the best possible must therefore be sought in dealing with each problem.

The materials most commonly used are natural earths, clays, and sands; various synthetic materials are, however, available. Refractories are acid, neutral, or basic. The chief acid materials are silica, and others of which silica is the principal constituent. They will combine with the metallic oxides to form silicates, the principal members of the group being quartz, quartzite, ganister, Dinas rock, sandstone, and flint. Dinas rock contains more than 90 p.c. of silica, the remainder being small amounts of alumina, lime, iron oxide, and alkalis; ganister may have as little as 92 p.c. silica. When silica is heated,

changes take place in its crystal structure, s.g., and vol., quartz being transformed into cristobalite and then into tridymite, with a linear expansion of more than 5 p.c. These factors must be taken into account in making Dinas or silica bricks, and when they are in use, the furnace must be heated slowly so that changes in them can take place without cracking or "spalling" the bricks.

Fireclay, which lies between the acid and neutral groups, contains 50 to 70 p.c. of silica, with 20 to 35 p.c. of alumina. The fireclays owe their plasticity to the presence of appreciable amounts of combined water; their refractoriness is adversely affected by the presence of alkalis. They are found associated with many of the coal measures in the U.K. and are widely used for the manufacture of firebricks used for all furnaces not requiring special refractories, as well as for blast furnaces, reverberatory furnaces, coke ovens, heat regenerators, flue stacks, etc.

Among the true neutral refractories are graphite or plumbago, silicon carbide, bone ash, and the most important crucible material, chromite, which is too expensive to be used except in special parts of certain furnaces. The basic refractories, which contain little or no silica, are very resistant to the attack of metallic oxides. The commonest are magnesite, lime, dolomite, alumina, and bauxite; thorium and zirconia have limited application. Lime is rarely used except in melting the platinum metals as it combines with water too readily. Dolomite is used in the steel industry for the linings of basic open hearth furnaces and converters. Natural magnesite contains more than 90 p.c. of magnesium carbonate, which is converted to magnesia when the bricks are burnt. It is used in the ferrous and non-ferrous industries for, e.g., the suspended roofs of copper reverberatory furnaces. Bauxite has rather limited use because it shrinks a great deal at high temperatures.

In making all refractory bricks, a proportion of crushed old bricks, termed "grog," is used, but nevertheless the consumption of refractories is one of the chief economic burdens of the metallurgical plant, every furnace usually containing several sorts of brick. As it is important to know the temps. at which refractories will soften during use, a series of standard compounds of various oxides has been made, called Seger Cones.

The refractory sample is tested by heating it in a furnace with a series of these cones, when it will be seen to soften at the same temp. as one of them, and is then said to soften at a particular cone. See Alumina; Firebrick; Grog; Metallurgy; Plumbago; Silica.

Refrigeration. Action of cooling, more particularly process of securing by artificial means a temp. lower than the surrounding temp. It is widely used for cold storage, ice and ice-cream making, and air-conditioning. In principle refrigerating plants are reversed heat-engines, and energy is thus required to absorb heat at a low temp., ejecting it to higher temp. surroundings.

The system now predominant, the vapour-compression type, consists essentially of compressor, condenser, and evaporator, together with an expansion valve. The medium or refrigerant is a gas easily liquefied under moderate pressures. Figure 1 shows the principle upon which the system works, the vapour being compressed until it can be liquefied by cooling water and then passing through the expansion valve to the

low-pressure zone, where the liquid evaporates, absorbing heat equivalent to its latent heat. (See Evaporation; Latent Heat.) From the evaporator the refrigerant vapour is compressed again, and the circuit thus completed, the process proceeding continuously. The material to be cooled may be refrigerated directly by the evaporation of the refrigerant in a direct-expansion system, e.g. the air inside a domestic refrigerator. Alternatively, as shown, brine may be cooled in an indirect system, and the cooler brine circulated where desired.

Various materials are employed as refrigerants. Ammonia is usual for large-scale plants, and refrigerator ships employ carbon dioxide. Smaller plants and domestic refrigerators employ sulphur dioxide and various halogenated hydrocarbons. The ca-

pacity of a refrigerating plant is stated in B.Th.U.s per hour under specified conditions, or in "tons of refrigeration." The standard ton of the American society of refrigerating engineers (A.S.R.E. ton), largely adopted internationally, is equivalent to

Refrigeration. Fig. 1. Diagram illustrating principles of vapour-compression cycle. Broken line denotes separation of "High Pressure" and "Low Pressure" zones

melting one U.S. ton of ice per day; i.e. 288,000 B.Th.U.s per day. Insulation of spaces refrigerated is necessary; cork is satisfactory for this.

Large plants are usually electrically driven, but automatic regulation of expansion valves and automatic safety devices are common. Since about 1930 there has been considerable advance in design, application, and popularity of fully automatic refrigerators of all sizes. They incorporate automatic devices controlling temp., refrigerant flow, and compressor operation; smaller machines dispense with water consumption by adopting air-cooled condensers. Mechanisms, including fans for condensers, are electrically driven, and are designed for many years'

Refrigeration. Fig. 3. The mechanism of a domestic refrigerator

operation with negligible skilled attention. Figures 2 and 3 show a typical domestic refrigerator and its mechanism. The restrictor liquid line replaces the expansion valve, but otherwise the components are identical with those in Fig. 1. Cabinet sizes are quoted in net storage capacity, 3 to 6 cu. ft. being popular.

Hermetically sealed compressors often replace belt-driven types. Here, both motor and compressor are enclosed within the refrigerant space, thus simplifying the mechanism and reducing the possibility of refrigerant leakage. Refrigerators operating on the absorption system eliminate compressors, by generation of ammonia from solution and subsequent re-absorption. Domestic refrigerators using the absorption system, with electric, gas, or paraffin heating, contain no moving parts, and are popular for this reason.

Refugee. Term applied to one who, for political or other reasons not criminal, is obliged to fly from his country of origin and take refuge elsewhere. Religious persecutions in the 17th century sent many refugees to England, and the country greatly benefited by the arts and crafts they introduced, e.g. the weaving and silk manufactures brought by the Protestant refugees from France after the revocation of the edict of Nantes, 1685. Political refugees in the 18th, 19th, and 20th centuries also, many of them, brought new industries and industrial processes, and included a number of distinguished scientists, doctors, writers, and musicians. Refugees from fascist Italy took refuge, for the most part, in France; those from Nazi Germany in the U.K. and the British Commonwealth, the U.S.A., and Latin America. The universities of Constantinople and Jerusalem gained especially from the presence in them of notable men of learning sent into exile by Nazi persecution. There were settled in the U.K. in 1939 some 80,000 refugees from Germany, Austria, and Czecho-Slovakia.

During the First Great War, a number of Belgian refugees from German occupation of their country made their way to England, where they were cared for until Belgium was free again. During the Second, refugees fled before the rapid German advance in 1940 from Belgium into France, from N. France to S. France, their blocking of the roads greatly hampering movement of Allied troops and supplies, and

their presence in unoccupied France proving a problem to the Vichy govt.

As the Allies advanced into Germany in 1945, millions of Germans fled from W. and E. to the centre of their country; in 1949 refugees and expelled persons in W. Germany from Polish- and Russian-occupied Germany, central Europe, and the Balkans totalled more than 9,000,000, constituting ten p.c. of the pop. in N. Rhine-Westphalia, 30 p.c. in Lower Saxony, 45 p.c. in Schleswig-Holstein. *See Displaced Person.*

A million Arabs fled from their homes to Arab Palestine and neighbouring countries after Israel was proclaimed in 1947; in June, 1950, 940,000 were receiving U.N. relief.

Refugee Organization, INTERNATIONAL. U.N. body set up, 1947, to care for displaced persons *See Displaced Person.*

Refuse. Literally, that which is rejected or worthless. The word refers especially to waste from factories and houses, the suitable disposal of which is essential to health. Three general methods have been used: (1) dumping on land and partly burning in the open; (2) dumping at sea; and (3) destruction in special furnaces. The first two are impracticable in any large community, the third is cleanly and comparatively inexpensive. *See Destructor; Salvage*

Regal. Small portable organ, dating from about 1460, and having one or more stops of beating-reeds. The origin of the name is uncertain, but it is probably derived from Lat. *regula*, rule, as the in-

strument was originally used to regulate or keep in order the singing of the monks. It was sometimes made to fold up, with an exterior resembling a book, hence the term Bible Regal. Amongst the instruments possessed by Henry VIII were several pairs of double (or full compass) regals, and of single (or short compass) regals. *See Organ.*

Regalia (Lat. *regalis*, royal). Emblems belonging to the sovereign as such. The regalia of the sovereign of Great Britain include S. Edward's crown, the imperial crown, S. Edward's staff and sceptre, the royal orb, a pair of bracelets or armillae, a ring, a mantle and other garments, a pair of spurs, the ampulla or golden eagle—a receptacle for the anointing oil—and a spoon for the oil. Others are the five swords, two of state, one of temporal justice, one of spiritual justice, and the curtana. There are also crowns and staves for the queen consort. All are used at a coronation. They are kept in the Tower of London, and most of them were made for the coronation of Charles II. The regalia of Scotland, crown, sword, and sceptre, are kept in Edinburgh Castle. The word is also used for certain rights belonging to the sovereign as lord of the land, these being relics of feudal times. *See Coronation; Crown, colour plate; Feudalism; Tower of London; consult also The English Regalia, C. J. H. Davenport, 1897.*

Regan. Character in Shakespeare's *King Lear*. One of the two elder daughters of the king.

Regalia of the British Sovereign. 1. Imperial Crown. 2. Orb. 3. S. Edward's Crown. 4. Ampulla. 5. Anointing spoon. 6. Spur. 7. Curtana. 8. Sword of state. 9. Queen's sceptre, with dove. 10. Queen consort's sceptre. 11. Imperial sceptre, with cross. 12. King's sceptre, with dove. 13. Sword of offering. 14. Sword of temporal justice. 15. Sword of spiritual justice. 16. Spur. 17. S. Edward's staff. 18. Maces

and the wife of the duke of Cornwall, she joins her sister Goneril in unfilial conduct to their father, and encourages her husband to put out the eyes of the king's faithful servant, the earl of Gloucester, with whose illegitimate son, Edmund, she falls in love. In the end she dies poisoned by Goneril, her rival for Edmund's love. *See King Lear.*

Regardant (Fr. *regarder*, gaze). In heraldry, looking backward or with intent gaze. *See Heraldry.*

Regatta (old Ital., contention). Sporting fixture on the water, consisting of races between single skiffs, rowing boats, or sailing yachts. The term was introduced from Venice, where it was applied to an annual boat race, in 1775, in which year the first English regatta was held on the Thames. The premier river regatta takes place in July at Henley-on-Thames, and Cowes at regatta time in Aug. is the Mecca of the yachting world. During the summer other regattas of varying importance are held on rivers or round the coast. At the smaller regattas the programme is not confined to "best boats," and may include aquatic sports.

Regelation. Term first used by Faraday for a phenomenon of freezing. When pursuing his investigations in heat at the Royal Institution in 1850 Faraday observed that, if two pieces of ice be pressed firmly together and then the pressure is removed, the pieces will unite into a solid block. What happened was that where the blocks were in contact the melting point of the ice was lowered because the pressure caused slight melting to occur; as soon as this pressure was released the freezing point of the water rose, the resulting freezing uniting the pieces. That ice will melt under simple pressure has since been frequently proved, and serves to explain many common phenomena.

Every schoolboy, in countries where snow occurs, knows that it is sometimes easier to make a snowball than at others. If the snow be very cold and dry it is not easy to make a firm ball, because the pressure of the hands is not sufficient to make the snow melt, which it must do before it can be formed into a ball. But if the temperature be somewhere near the freezing point, such pressure as can be given by the hands will suffice to melt the particles of snow where they are squeezed together, thus forming a little water which, as soon as the pressure is released, freezes and binds the snow into a ball. In skating, the pressure under

the edge of a skate is very great. The skater therefore glides about on a narrow film of water which forms continuously at the surface of contact with the ice, freezing again when relieved of pressure. On very cold ice it is difficult to obtain a "bite," and hollow-ground skates will have the advantage over the type in which the bearing area is larger and the exerted pressure hence less.

A demonstration of regelation is to take a block of ice and pass over it a loop of wire attaching a weight below to the wire. The wire will cut its way through the block, but as fast as it does so the block will freeze solid again. Regelation also largely explains the formation of glaciers which begin as snow. *See Glacier.*

Regency. In British history the term used in particular for the period 1811-20, when the prince of Wales (afterwards George IV) ruled the country as prince regent, his father George III being incapacitated through mental disorder. The period gave its name to a style of architecture and applied decoration. Deriving in part from the French Directoire, and a modified form of Palladian, it flourished both before and after the regency, roughly 1800-37. Nash's Regent St., London, with its Quadrant, exemplified Regency architecture at its best; other examples include his Regent's Park terraces of stuccoed mansions with pseudo-Greek decorations, balconies, and bow windows. There are fine examples of Regency architecture at Brighton and Hove, Bath, and Cheltenham. In France the term applies to a transitional style between the classic splendour of the Louis XIV period and the fantastic rococo of Louis XV's reign.

Regeneration (rebirth). Name given to the divine act or process by which the life and character of a man are changed when he becomes a Christian. Regeneration is the correlative of conversion. Conversion represents the human side, i.e. what the man himself does through repentance and contrition; regeneration represents the divine side, i.e. what God does for the man by the gift of grace and the Holy Spirit to make the conversion effective. Many attempts have been made to define and explain the process exactly.

A number of theologians have maintained that regeneration confers upon man a new spiritual faculty, hitherto unpossessed, which enables him to grasp and assimilate Divine truth. Others hold

that it wakes into life a religious consciousness which has hitherto been dormant. Others again say that it alters the balance of forces in a man's life and enables the higher and more spiritual side of his nature to obtain the mastery over the lower and more carnal. Something analogous to the Christian conception of regeneration is found in other faiths. The doctrine of the "twice-born man" plays a great part in the religions of India. In the Greek mystery religions the conception of regeneration is of great importance. The Hermetic literature declares that "regeneration is the end of all revelation." *See Incarnation.*

Regeneration. The power of reproducing by new growth parts of the body that have been lost by accident or amputation. It is observable chiefly in the lower orders of animals, in which there is greater liability to loss from the attacks of enemies. Trembley's celebrated experiments with the fresh-water hydra nearly 200 years ago demonstrated that, if a hydra is cut across, the basal portion reproduces the lost mouth and tentacles, and the upper half reproduces a new base. If divided vertically, the left side produced a new right half, and the original right a new left. Sponges and sea-anemones have a similar power of repair, and the common starfish frequently affords evidence of having lost one or more of its rays, which it has reproduced on a smaller scale. The brittle-stars are so called on account of their readiness to part with their rays on the

Regeneration. Spider crab, with left pincer leg being reproduced after loss. Top, slow-worm reproducing lost tail, seen on extreme right

slightest alarm, the lost members being reproduced with facility.

In insects this power is not commonly exhibited, but the stick-insects, which are very liable to lose their long legs, reproduce them when they moult; at first they are

bud-like, but with each successive ecdysis the new limb becomes larger. In this they follow a similar course to the higher crustacea, which frequently lose limbs—often voluntarily, as a means of escape from danger—and gradually replace them when they moult. Regeneration is equally common among molluscs, especially the sea-snails (gastropods), which, when active, are only partly protected by the shell, and the head or hinder part of the foot may be bitten off by fish. The mollusc is able to renew the lost parts. Injuries to the shell are repaired by the mantle which secreted it.

Among vertebrates the phenomenon is much less common, but fishes have been known to reproduce lost fins, and the batrachians limbs and tails. Spallanzani barbarously amputated all the legs and the tail of a salamander no fewer than six times, and they were reproduced each time. Bonnet repeating the experiment succeeded eight times with one salamander. The slow-worm, the gecko, and the common lizard readily part with their tails if these are held, and the stump develops a new tail, but it is several years before the new part equals that which has been lost.

There is something of the same nature in plants. A spruce whose leading shoot has been destroyed will replace it by the upward growth of a bud that was intended to develop into a lateral branch. When a limb has been broken off a large tree by a gale the bark will grow over and protect the wounded part, which may later continue its growth from resting buds. A cutting of a plant will seek to restore its lost base by throwing out roots. See Biology; Botany; Insect.

Regenerator OR **REGENERATIVE FURNACE.** Metallurgical apparatus. When Siemens invented the open hearth for making steel, he found it impossible to reach the necessary high temperatures without preheating the gas and air going into the furnace. A similar conclusion had been reached by Neilson in 1828 in regard to the blast furnace, and he increased efficiency by preheating the blast. There are two systems of preheating gases and air; both use the heat that remains in waste gases after they leave the furnace. The two types of plant are called recuperators and regenerators. In recuperators the heat exchange is carried on continuously, the waste gases and the ingoing gas or air being separated.

Regenerator. Diagram illustrating the principle on which a regenerator works. See text

gases are heating the chequer work in chamber A, the hot brickwork in chamber B is heating the cold ingoing air or gas. After a certain period the valves are switched, so that A and B are reversed. Regenerators are commonly used for steel furnaces; recuperators more often in the gas industry.

Regensburg. City of Germany.

The capital of Lower Bavaria, it stands at the confluence of the Regen with the Danube, 65 m. N.N.E. of Munich. The French call it Ratisbon, and this name commonly occurs in English history books. It is one of the oldest and most interesting surviving German cities. A Celtic settlement, Radaspona, 500 B.C., it became the Roman Castra Regina in A.D. 179, residence of a Bavarian dynasty c. 500, of the emperor Louis the German 826, a free city 1245, and from the 16th century was the seat of German diets until 1806. This glorious past is reflected in buildings, which largely survived

Recuperators are usually made of some sort of refractory material, but may be of metal.

Regenerators work on a discontinuous cycle, each of two chambers being heated in turn by the waste gases to a high temperature and then giving its sensible heat to the cold air or ingoing gas during the next half of the cycle. In the diagram, while waste

the Second Great War: the cathedral of S. Peter, an early Gothic pile (1275-1524), with twin towers 330 ft. high; an abbey with Roman basilica (12th century), S. Ulrich's church (1240), S. Cassian's (15th century), the Benedictine monastery of S. Emmeran with a Roman church (8th-12th centuries) where several emperors are buried. Secular buildings are the old town hall (13th-14th centuries), the palace of Thurn and Taxis princes (with precious library), the courts of the Bavarian dukes and of the bishops, a stone bridge (1135-46), and old houses and castles, among which is the famous Golden Tower with its ten floors.

Modern Regensburg, from 1810 incorporated with Bavaria, after having been held by Napoleon, became an industrial and transport centre, with river port on the Ludwig Canal, shipyards, breweries, and sugar, tobacco, printing, oil refining, wood, and stone industries. There are a R.C. academy for theologians and teachers, many other educational institutions, a theatre, museums, observatory, archives, libraries, and race-course. Pop. (1950) 120,000.

The object of a number of attacks by Allied bombers during the Second Great War on account of

Regensburg, Germany. The early Gothic style cathedral of S. Peter, with its 330 ft. high spires

Regent's Park. Plan of this London park, opened to the public in 1838

H.M. Stationery Office

the presence in or near the city of two Messerschmitt plants, a jet-plane factory, and an oil refinery, Regensburg was captured April 27, 1945, by units of the U.S. 3rd army. After the surrender of Germany it lay within the U.S. zone of occupation.

Regent (Lat. *regere*, to rule). One who rules temporarily for a sovereign. The first regent of England was William Marshal, earl of Pembroke, at the accession in 1216 of the boy Henry III. The most famous regent of Scotland was James Stuart, earl of Murray or Moray, appointed after the abdication of Mary Queen of Scots, 1567. When George III was declared incapable of ruling, the prince of Wales became prince regent, 1811. Regents of the 20th cent. were Prince Paul of Yugoslavia, whose brother King Alexander, murdered in 1934, left a young son Peter; and Prince Charles, regent of Belgium in the absence of Leopold III from 1944. Hungary, historically a kingdom, had no monarch after the First Great War, but Admiral Horthy called himself regent, 1920-44.

The first permanent provision for a regent in Great Britain was made by the Regency Act, 1937. At the accession of King George VI, the heir presumptive to the throne was Princess Elizabeth,

then aged ten. This Act provided that if the sovereign was under 18, or at any time totally incapacitated by infirmity of mind or body, or for some definite cause not available, then the functions of the sovereign should be carried out by a regent. The incapacity of the sovereign must be declared in writing by the wife (or husband) of the sovereign, the lord chancellor, speaker of the house of commons, lord chief justice, and master of the rolls, or any three of these. The regent is the person next in succession to the throne, unless he is not a British subject of full age domiciled in the U.K.,

or is a Roman Catholic or married to one. A regent has no power to change the succession or alter the Protestant religion as established in Scotland. This Act of 1937, as amended by the Regency Act, 1943, also makes provision for counsellors of state (*q.v.*) to perform the functions of a

sovereign abroad or temporarily incapacitated.

Regent's Canal. London canal. It was constructed in 1812-20 by Nash, and named after the prince regent, afterwards George IV. The E. end is N. of the Thames, opposite the Surrey Commercial Docks; it crosses the Zoological Gardens in the N. of Regent's Park, and joins in Paddington the Grand Union Canal with which it was amalgamated in 1928.

Regent's Park. London park. Covering 472 acres in the bor. of Marylebone, it lies between St. John's Wood and Camden Town. It contains the gardens of the Zoological Society (the London zoo); that of the Toxophilite Society; and, within the Inner Circle, Queen Mary's garden, renowned for roses, and the open-air theatre. There is an artificial boating lake of 22 acres, and the Regent's Canal skirts the N. side. On the W. side is Regent's Park College; to the S. is Bedford College for women (*q.v.*). S. Katharine's Royal Collegiate Hospital, removed to the E. side from its site near the Tower, 1825-29, became redundant, 1948, and its chapel was leased to the Danish community in London.

Deriving its name from the prince regent, afterwards George IV, and once part of the ancient manor of Tyburn, Regent's Park, which is crown property, was laid out in 1812 by James Morgan, designed by John Nash, and was opened to the public in 1838.

Regent Street. London thoroughfare. It runs from Waterloo Place, Pall Mall (being Lower Regent Street as far as Piccadilly Circus), and passing Oxford Circus, finishes at Langham Place. One of London's great shopping centres, it was made in 1813-20 from designs by John Nash to connect

Regent Street, London. This famous thoroughfare and shopping centre, looking towards Piccadilly Circus

Carlton House (*q.v.*) with Regent's Park and the house which was to be built there or on Primrose Hill for the prince regent. Near the N. end is the Polytechnic. In the 1920s, as the leases which were crown property fell in, much of the street was rebuilt, to be reopened by George V in 1927. Many lovers of architecture have regretted the disappearance of the old colonnade and the curving line of Nash's buildings. Little permanent damage was done in the Second Great War, although one German bomb fell in the highway. See Nash. John; Piccadilly Circus.

Reger, Max (1873-1916). German composer. Born at Brand, Bavaria, March 19, 1873, he studied under Riemann, met opposition from German critics on account of his determination to be "progressive," but found a public for his first orchestral work, a *sinfonietta*, 1906. He became a teacher of composition at Munich, musical director at Leipzig, director of the court orchestra at Meiningen, and he died at Leipzig from a heart attack, May 11, 1916. A prolific composer in the Brahms tradition, Reger's organ fantasies and fugues are more important than his violin and piano concertos. It was said that he achieved for the organ the development which orchestral music had undergone in the 19th century. Orchestral works include a symphonic prelude to a tragedy, romantic suite, and variations on a theme by Mozart. He also wrote chamber music, songs, and piano pieces.

Reggio di Calabria. Southernmost prov. of the Italian mainland, in Calabria. It is almost surrounded by the Mediterranean Sea, and has an area of 1,219 sq. m. A promontory with a central ridge, a spur of the Apennines, it rises in Aspromonte (*q.v.*) to nearly 9,000 ft. The region is subject to seismic disturbances, but is on the whole fertile, producing chestnuts, oil, wine, silk. Coal is mined. Scilla, held by the British, 1806-08, is famous in the legend of Scylla and Charybdis (*q.v.*).

Reggio di Calabria. City of Italy, capital of the prov. of Reggio di Calabria. The ancient *Regium Julium*, it stands on the strait of Messina, 8 m. S.E. of the city of Messina and 248 m. by rly. S.S.E. of Naples. Always subject to earthquakes, it has several times been destroyed, notably in 91 B.C., on Feb. 4, 1783, and on Dec. 28, 1908, when the shock was followed by a tidal wave and 30,000 people

perished. Every building suffered damage, and those left standing had to be demolished. There is a trade in perfumes, silk, terra-cotta, oil, dried fruits, etc. Reggio was founded by Greeks about 720 B.C., and became a Roman colony in the 3rd century B.C. In the Second Great War Reggio was a base for German and Italian air forces operating over the Sicilian and Mediterranean narrows, and was frequently attacked by Allied bombers. On Sept. 3, 1943, British and Canadian elements of the 8th army went ashore at Reggio in the initial landings of the Allied invasion of Italy. Pop. 136,586.

Reggio nell' Emilia. Prov. of N. Italy, in Emilia. It slopes from the Tuscan Apennines to the Po valley, and has an area of 885 sq. m. Mountainous in the S., its culminating point is Mt. Cusna, alt. 6,420 ft. It is otherwise a fertile plain producing rice, wheat, vines, fruit, olives, and chestnuts. There are copper, iron, and sulphur mines. The chief manufactures include porcelain, glass, and silk.

Reggio nell' Emilia. Walled city of Italy, capital of the

Reggio nell' Emilia, Italy. The basilica of San Prospero, and market place

province of the same name. The ancient *Regium Lepidi*, it stands on a small affluent of the Po, 38 m. by rly. N.W. of Bologna. A fine city, with broad, arcaded streets, it has a cathedral founded in the 12th century and rebuilt in the 15th and 16th centuries. The church of Madonna della Ghiara is a beautiful Renaissance domed structure dating from 1597. There are Renaissance palaces, and the house where Ariosto was born. The centre of an agricultural district, Reggio exports cheese, rears silkworms, and manufactures textiles, brooms, and leather goods. Founded in 187 B.C. by Lepidus, when he built the Via Aemilia, it flourished under the Romans, and became a bishopric in 450. In medieval times the city was an independent

republic, passing under the control of the Este family in 1409. Overrun by the Allied 5th army, April 25, 1945, after the Germans had withdrawn, it escaped damage in the Second Great War. Pop. 105,590.

Regia Aeronautica. Name of the former Italian air force. This was rapidly developed and expanded under fascism, but its first experience of active service was inglorious — bombing and machine-gunning defenceless Abyssinian towns in 1935. Regia Aeronautica took part in the Spanish Civil War (*q.v.*), where its tactics, machines, and crews were overshadowed by those of its German ally. When Italy entered the Second Great War, her air force had a front line strength of some 2,000 aircraft, but only about 75 p.c. was available for home concentration, the remainder being in Libya and E. Africa. The potential strength of Regia Aeronautica lay not so much in numbers as in strategic mobility. Well equipped bases on the mainland brought Malta within easy range of Italy, while from Libya Italy could attack Alexandria and Greece. One of the chief Italian aims was the production of a fast long-range bomber to dominate the Mediterranean; the most efficient machine of this type was the Savoia 79.

Of the war-time strength of the Italian air force, approximately half was in bombers, while there were squadrons of aircraft specially designed for low flying attack on ground objectives. The machines were nearly all of a composite wood and metal construction, which made for flexibility and cheapness. But the geographical position of Italy laid her aircraft factories open to enemy bombing attack unless she could command the Mediterranean, and persistent Allied bombing virtually eliminated Regia Aeronautica early in 1943, reducing it to a despised adjunct to the Luftwaffe. Throughout the war, the spirit of the air force personnel was generally lacking in aggression. On only one occasion, in Sept., 1940, did the Italian air force attack the British Isles. By the peace treaty of 1947, the Italian air force was limited to 200 fighter and reconnaissance, and 150 transport, training, rescue, and liaison aircraft.

Regiam Majestatem. Name given to a collection of the ancient laws of Scotland. It is said to have been compiled during 1124-53 at the instance of

David I. Its authenticity is doubtful, and the book is an almost literal copy of Glanvill's *Tractatus de Legibus*, written in the reign of Henry II.

Regicide (Lat. *rex*, king; *cædere*, to kill). Literally, one who kills a king. The word is specially used for those who were responsible for the death of Charles I in 1649. Of the 150 members of the court of justice that tried the king, 67 voted for his execution and 59 signed the death warrant, and these, with the officials and executioners, were the regicides. After the restoration of Charles II, parliament ordered the arrest of the regicides. Some surrendered and others were caught, but a few escaped. Brought to trial, 29 of them were sentenced to death, but the sentence was only carried out in 10 cases, the others being imprisoned for life. Three others were afterwards caught and executed. Harrison and Peters were among those executed, and Ludlow was the last survivor.

Regillus. In ancient geography, a small lake in Latium, Italy. Situated E. of Rome, between Gabii and Labicum, it was famous for the defeat of the Latins by the Romans, 496 B.C. The story of the fight is told in Macaulay's *Lays of Ancient Rome*.

Regiment (Lat. *regimentum*, government). Organized body of troops under a field officer. In the British army it is the largest permanent unit, and is made up of companies, troops, and battalions or squadrons. The term regiment was first used in Cromwell's new model army, each unit of cavalry or infantry being called a regiment, and usually taking its title from the name of the officer commanding it. Cavalry and infantry were in companies for administrative purposes. As warfare became more tactically complicated, the battalion and squadron were established as fighting formations, but battalions of several thousand men proved too unwieldy for tactical and administrative purposes, and were gradually reduced until each formed only a fraction of a regiment.

With the establishment of the British standing army in the reign of Charles II, the new cavalry and infantry units were formed into regiments and numbered consecutively in order of seniority. Thus the Royal Scots, a regiment which had served with the king in exile, became the 1st Foot and senior infantry regiment of the line; and the Queen's Regiment, the first to

be raised in England for the new army, became the 2nd Foot. Early in the 18th century, the infantry regiment was generally fixed at a strength of 1,000 officers and men, but occasionally it had two battalions, each 1,000 strong.

In 1881 the infantry regiments were given county designations, and the single battalion numbered ones were amalgamated to form regiments of two battalions. Seniority continued to be based on the original line numbers. As now constituted, a British infantry regiment has two regular battalions each of approximately 950 officers and men commanded by a lieutenant-col. To simplify training and drafting, infantry regiments in 1947 had their second battalions reduced to skeletons. Attached to each infantry regiment are Territorial army and cadet force battalions, and each complete unit is under a colonel. Some regiments have no territorial designations, e.g. the Guards, the Rifle Brigade, the King's Royal Rifle Corps. The Royal Engineers, Royal Signals, R.A.S.C., and Royal Armoured Corps also rank as regiments. Until the Second Great War, the Royal Artillery was a single regiment, but it is now divided, the term artillery regiment replacing the old designation of battery.

During the Second Great War were added to the British army the Parachute Regiment and Glider Pilot Regiment. In 1942 there was raised the R.A.F. Regiment for the ground defence of airfields and to act as an airborne striking force. Cavalry regiments are complete combat units, not divided into battalions. Foreign regiments are usually much larger than British, frequently having four battalions, with artillery and ancillary services. See *Army*; *Battalion*; *Infantry*; also separate entries on regular regiments of the British army.

Regimental March. Piece of music officially approved by the War office to be played by a British regiment at the march past, or other official regimental occasions, and occasionally upon the dismissal of a parade. Most regimental marches were adopted during or after the Napoleonic Wars, and in general the tune chosen was associated with the county in which the regiment had been raised; which explains the unmartial bucolic and love songs peculiar to many regiments. Among these are: *Here's to the Maiden* (King's Liverpool); *We've Lived*

and *Loved Together* (Devon); *Young May Moon* (Sherwood Foresters); *Corn Rigs are Bonny* (Royal Lancs); *A Southerly Wind* and *a Cloudy Sky* (E. Surrey); *The Lincolnshire Poacher* (Lincs); *John Peel* (Border); *Speed the Plough* (Suffolk); *My Boy Willie* (Royal Tank); *Begone Dull Care* (Royal Signals); *Bonny Nell* (R.A.M.C.); *Within a Mile o' Edinbro Town* (Cameronians); and *The Yorkshire Lass* (E. Yorks).

Among the more martial tunes of English regiments are *Ca Ira*, the French revolutionary song adopted by the West Yorkshires; *Men of Harlech* (South Wales Borderers); *Prince Albert's march* (Somerset L.I.); and *I'm Ninety-Five* (Rifle Brigade, commemorating the fact that before they were taken out of the line to become riflemen they were the 95th Foot). The British Grenadiers, regimental march of the Grenadier Guards, is also that of all fusilier regiments.

All Scottish regiments have pipe bands, and as the bagpipes are adapted to battle songs or laments, most of the Scottish regimental marches are of a stirring air: *Blue Bonnets over the Border* (King's Own Scottish Borderers); *Cock o' the North* (Black Watch); *Hielan' Laddie* (Scotts Guards); *March of the Cameron Men* (Cameron's); *Scotland for Ever* (Seaforth's); *The Campbells are Coming* (Argyll and Sutherland Highlanders); *Garb of Old Gaul* (Scotts Greys). The Royal Scots, oldest regiment in the British army, marches to *Dumbarton's Drums*, recalling that the regiment was enrolled by the earl of Dumbarton in 1660. Several English regiments have Scottish marches: *Highland Pipers* (Hampshire); *Lass o' Gowrie* (Middlesex and W. Kent); *A Hundred Pipers* (Essex); *Wha Wadna Fecht for Charlie* (Cheshire) not a relic of the Forty-Five, but commemorating Sir Charles Napier, colonel of the regiment at the battle of Melanee.

David Le Roi

Regina. Capital of Saskatchewan, Canada. It is in the S. of the province, in the centre of the wheat-growing area, 360 m. W. of Winnipeg, and on the C.N.R. and C.P.R. Its chief buildings are the new home of the provincial legislature and the city hall. It is the residence of the lieutenant-governor, and was for a long time the headquarters of the Royal North-West (now Canadian) Mounted Police. Industries are

both distributing and manufacturing. For the former are grain elevators, warehouses, etc.; the latter include the making of agricultural implements, motor cars, bricks, and machinery, as well as meat packing and oil refining. Before the foundation of the province of Saskatchewan, Regina was the capital of the North-West Territories. Pop. 64,000.

Regiomontanus (1436-76). German mathematician and astronomer. Born at Königsberg, in Franconia (hence his name, a Latin version of the name of his place of birth), June 6, 1436, his real name was Johannes Müller. Educated at Vienna, he became the pupil of Georg Purbach, and with him translated the works of Ptolemy, Apollonius, Archimedes, and Hero of Alexandria. In 1533 was published his *De Triangulis Omnimodis*, a treatise on plane and spherical trigonometry, and *Algorithmus Demonstratus*, 1534. Regiomontanus established an observatory at Nuremberg and compiled tables of eclipses and other astronomical data. His help was requisitioned by Pope Sixtus IV in connexion with the reform of the calendar, and he died in Rome, July 6, 1476.

Regional Commissioner. Official appointed in the U.K. in the Second Great War to administer civil defence services in one of the regions into which the country was divided. There were ten regional commissioners for England, one for Scotland, and one for Wales. Each was responsible to the minister of Home Security, but had authority to settle, without consulting London, all immediate

problems arising from severe air raids. See Civil Defence.

Register (L. Lat. *registrum*, book of record; ultimately from *regerere*, to bring back). Written account or record; official list of particulars, such as the list of persons entitled to vote at parliamentary and other elections.

Parish registers of births, marriages, and deaths were ordered to be kept by the incumbent of every parish in England and Wales by Thomas Cromwell, Henry VIII's

Regina, Canada. The Saskatchewan provincial legislature buildings. Top, left, the municipal offices

minister, in 1538. Before this time a certain amount of information with regard to well-known personages had been recorded in the monasteries, and some of these sporadic records still exist. But the new order proved unpopular, and in many cases the registers were kept in so slovenly a fashion that in 1597 Elizabeth ordered copies to be sent to the bishop of the diocese. More stringent regulations for the accurate compiling of the registers, and for their safe keeping, were enacted by law in 1812, and in 1836 came official registration by a govt. dept.

Nevertheless, despite defects and other hindrances to research, parish registers have proved of much value to students as affording contemporary evidence of the exact dates of births and deaths, and also as throwing by way of additional notes interesting sidelights upon social life and other matters which were sometimes quite unofficially added by some of the clergy. Many parish registers have been published for general information by the Harleian, Parish Registers, and other societies. (See Mortality. Consult Parish Registers of England, J. C. Cox, 1910.) Wills were registered at Doctors' Commons, Knighttrider Street, London, E.C., until 1874, when their registration and filing department was removed to Somerset House.

British shipping was first registered in 1660 under the Navigation Act. The regulations were amended by legislation in the reigns of George III and William IV. The controlling Act is now the Merchant Shipping Act, 1894, which provides for the registration of every British ship, except those of 15 tons or under, plying on the rivers or coasts of the U.K., and certain vessels of 30 tons or under engaged in fishing or trading in and about the Gulf of St. Lawrence. (See Lloyd's Register.)

The term register is also used for the sliding or adjustable plate for regulating the draught in a fire-grate; in printing, for the exact correspondence of the letterpress on both sides of a page, and of the three or four colour impositions in colour-printing.

The National Register, drawn up in the U.K. during each of the two Great Wars, in order to provide an accurate picture of the population for the introduction of compulsory service and the issue of identity cards, is separately described. See National Register.

Register. (1) Division of the human voice, arising from the nature of the vocal cords, and evincing a difference of tone-quality. As it is obvious that the tension of the cords cannot be carried beyond a certain point, the upward range is continued by means of a change of mechanism. Different teachers have different names for these registers, the most common being chest, head, and falsetto. These terms accurately describe the respective aspects of the vocal cords in the successive registers, *viz.*, lower and upper thick, lower and upper thin, and small. The aim of the teacher is to blend the registers so that the transition from one to another is effected without that abrupt change of quality known as a break. (2) Synonym for organ stops. Registration means the indication on the music of the stops which the composer desires to be used. See Voice.

Registrar OR **REGISTRARY.** One who keeps a register or record. In Great Britain a registrar was formerly called a register. In England there are registrars for the supreme courts and county courts, district registrars in large towns, registrars for companies, building and friendly societies, etc. (See Friendly Societies.) In each district there is a registrar to whom particulars of all births and deaths must be given. These registrars also issue certificates for marriages, which can be performed in their offices.

Registrar-General. Official who superintends the registration of births, marriages, and deaths in England and Wales. His headquarters are at Somerset House, London, W.C.2. The first registrar-general was appointed in 1836, and in 1874 he took over the compilation of vital statistics. By summarising the returns from the various districts the registrar-general is able to issue quarterly returns of births, marriages, and deaths; he also issues a yearly blue-book.

There is a registrar-general for Scotland, his offices being at the Register House, Edinburgh. The registrars-general and their departments are responsible for taking the national census. Quite distinct from these officials is the registrar-general of shipping and seamen. See Birth Rate; Death Rate; National Register.

Registration. Act or fact of registering. The word is used in several connexions. In Scots law it means the transcribing of documents in a public register, in order that an exact copy may be preserved for use in the event of the destruction of the original.

The registration of births, marriages, and deaths was made compulsory in England and Wales in 1836, and came into force in 1837. Before this time the only official source of information on this subject was the parish register (*q.v.*). By the Births and Deaths Registration Act, 1836, district registrars have to send copies of registers of births, marriages, and deaths to superintendent registrars, by whom they are forwarded to the registrar-general. Subsequent legislation put the onus of registering births on parents and others, and of registering deaths on relatives and others within certain limits of time after the event. Marriages are recorded by the officiating clergyman, or the registrar, at the time of the ceremony. The registration of electors is a necessary preliminary to the exercise of the franchise.

Registration. Method of protecting money and other property in transit from loss. Letters and parcels can be registered at any U.K. post office for a fee, and luggage can be registered with railway companies. Under the Crown Proceedings Act, 1947, compensation will be paid for loss of or damage to a registered postal packet due to negligence of the post office. The maximum amount of compensation payable depends on the amount of the fee paid.

Registration of LAND. Two systems of land registration are possible. The first is registration of all deeds so that a person proposing to buy land or advance money on mortgage may know that in investigating the title of the vendor or borrower he need only consider deeds in the registry. He will still have to satisfy himself that the deeds give a good title and so make it safe for him to buy it or lend money on a mortgage of the land. (*See Land Charges.*) The second system is registration of title, by which the owner of land may, on satisfying the registry authorities that the title deeds show he has a good title, have himself registered as the owner. Thereafter any prospective purchaser or mortgagee need not investigate the title deeds. He can rely on a certificate from the registry.

In 1830 a royal commission in England reported against registration of title and in favour of registration of deeds, but no action was taken. Registration of title was recommended by another royal commission in 1857 and the Land Registry Act, 1862, introduced registration of title on a voluntary basis. Little use was made of this Act or of an amended system introduced in 1875. The Land Transfer Act, 1897, made registration of title compulsory on any sale of land in any area to which the Act was applied by order of the privy council. This was re-enacted by the Land Registration Act, 1925. The intention is that registration to title should ultimately be compulsory throughout England. It is now compulsory on a sale of land in the city and county of London, Eastbourne, Hastings, Croydon, and the county of Middlesex.

A person may be registered (1) with an absolute title, indicating that his freehold or leasehold appears to be without flaw; or (2) with a qualified title indicating that there is some flaw in the title (though this is rare); or (3) with a possessory title, usually as a temporary measure indicating merely that he is in undisturbed possession and knows of no adverse claims; or (4) with a good leasehold title, this form of registration being necessary only when a leaseholder cannot register his leasehold with an absolute title, *e.g.* because he is not in a position to prove the validity of his lessor's title.

The fact that the land registry registers land with an absolute

title does not mean that a person who, unknown to the registry, has a better title, is deprived of his land. Should such a person establish his claim the land registry will compensate any person who has suffered loss through relying on the title in the register.

All changes affecting the land which, for unregistered land, would be registered under the Land Changes Act are, for registered land, entered on the register to title to the land. All later transfers of the land must be registered.

The register is divided into three parts: (1) the property register which indicates the exact position of the land; (2) the proprietorship register which indicates the nature of the title registered; (3) the charges register which indicates the charges on the land.

In Scotland there has been since 1617 in the register of sasines a system of registration of all deeds relating to land. There have been registers of deeds relating to land in Middlesex and Yorkshire since the reign of Queen Anne. In some parts of Europe registration of title has existed for centuries.

Registration of MOTOR VEHICLES. This subject is treated under Motoring.

Regius Professor. Holder of a university professorship founded by a king. The first of these were founded in 1546 by Henry VIII: chairs of divinity, civil law, history, Greek, Hebrew, and physics at Cambridge, and of divinity, civil law, medicine, Hebrew, and Greek at Oxford. In 1724 George I established the regius professorship of modern history at Oxford.

Regnal Year. System employed in Great Britain for dating Acts of parliament. Each regnal year of a sovereign begins on the anniversary of his accession; thus the regnal year one of King George VI began on Dec. 12, 1936, so that the period Dec. 12, 1947-Dec. 12, 1948, was his 12th regnal year. The last regnal year of a sovereign ends at death or abdication, and legislation passed in a calendar year which includes parts of two regnal years is dated accordingly. Thus Acts of the parliamentary session of 1910 are dated 10 Edw. VII and 1 Geo. V.

Regnard, JEAN FRANÇOIS (1656-1709). French dramatist. Born in Paris, Feb. 7, 1656, he led an adventurous life until 1683, when he settled down to play-writing. He was the most brilliant of the followers of Molière, but his comedies, *e.g.* *Le Joueur*, *Le Lé-*

gataire Universal, though witty in dialogue and clever in characterisation, are wanting in that master's depth and moral earnestness. He died Sept. 4, 1709.

Jean Regnard,
French dramatist

Regnault, HENRI VICTOR (1810-78). French physicist. Born at Aix-la-Chapelle (Aachen), July 21, 1810, he studied chemistry under Liebig, and in 1840 was appointed professor of chemistry at the École Polytechnique, Paris, becoming professor of physics at the Collège de France, 1841, chief engineer of mines, 1847, and director of the Sèvres porcelain factory, 1854. He died Jan. 19, 1878.

Regnault made a lasting reputation for his measurements of many physical constants, particularly those concerned with specific heat. He showed that the specific heat of an alloy can be obtained from those of its constituent parts, and that the specific heat of compounds bears a relation to the specific heats of the elements composing them. He also carried out a series of experiments on the densities, pressures, and volumes of gases which affected the kinetic theory of gases.

Régnier, HENRI FRANÇOIS JOSEPH DE (1864-1936). French poet and novelist. He was born

at Honfleur Dec. 28, 1864, and studied law in Paris. A disciple of Mallarmé and Verlaine, he came to occupy a leading position among those so-called symbolists. His

Henri de Régnier,
French poet

many volumes of poetry included *Poèmes Anciens et Romantiques*, 1890, in which old-time stories were rendered with new symbolic significance; *Tel Qu'on Songe*, 1892; *Aréthuse*, 1895; and *La Cité des Eaux*, 1903. Among his realistic works in prose fiction are *Le Trèfle Noir*, 1895; *La Canne de Jaspe*, 1897; *Les Vacances d'un Jeune Homme Sage*, 1903; *Le Passé Vivant*, 1905; and *La Peur de l'Amour*, 1906. Later works included *La Pêcheresse*, 1920; *L'Escapade*, 1926. He died May 23, 1936.

Régnier, MATHURIN (1573-1613). French satirist. Born at Chartres, Dec. 21, 1573, he was a poet of real genius, who showed

his independence by ridiculing the all-powerful Malherbe. He wrote some charming *poésies diverses*; but his fame rests upon his 16 satires, the first masterpieces of their kind in French literature. He died, after a dissipated life, at Rouen, Oct. 22, 1613. *Consult* Life, J. Vianey, 1896.

Regnitz. River of Bavaria. Its two head-streams unite near Fürth, and the river flows N. past Erlangen and Forchheim, and joins the Main near Bamberg. It is 125 m. long, and its chief tributaries are the Aisch, Grundlach, Aurach, and Zenn. It is navigable throughout its lower course.

Regrating (old Fr. *regrater*, to huckster). Formerly an offence against public trade. It is described in a statute of Edward VI as buying of corn or other dead victual in any market and selling it again in the same market or within 4 m. of the same place, and was prohibited as tending to enhance the price of the provisions, since every successive seller must make a profit. With regrating, forestalling (*q.v.*) and engrossing (*q.v.*) were also forbidden. The offences were misdemeanours punishable by fine, imprisonment, and pillory. The early statutes directed against them were repealed under George III. The word regrator continued, with limited use, in the sense of a dealer or middleman.

Regression (Lat. *re*, back; *gressus*, stepped). In psychology, a process of turning back from life's actual problems to the security experienced by an infant, which Jung says can even render the patient blind, deaf, dumb, and infantile.

Regular (Lat. *regula*, rule). Among the clergy a regular is a member of a monastic order, the opposite being the secular clergy who are not monastic. A regular soldier is one who joins the army for a long period and gives his whole time to it. Irregulars, on the other hand, join for a period of special need. *See* Army, British; Monasticism; Secular.

Regulus. First star in the constellation of the Lion, or Alpha Leonis. In ancient Persia it was the chief of the four royal stars. It is a bright star of about the first magnitude, and has a luminosity equal to that of 100 of our suns. It has a double satellite of the eighth magnitude.

Mathurin Régnier,
French satirist

Regulus (Lat., dim. of *rex*, king). Term in metallurgy used to describe an impure metal obtained from its oxide or sulphide by fusing one of these with a reducing agent. The term was first used in alchemy to describe impure gold and, later, antimony.

Regulus, MARCUS ATRIUS. Roman general. He became consul for the second time in 256 B.C., and defeated the Carthaginian fleet at Ecnomus. An expedition to Africa followed, in which Regulus first defeated the Carthaginians. But a Greek mercenary named Xanthippus, taking command of the Carthaginian forces, subjected the Romans to a crushing defeat, Regulus himself being taken prisoner. He is said to have been sent by the Carthaginians to Rome in 250 B.C., under parole to return if the peace which the Carthaginians desired was not arranged. So far from recommending the Romans to conclude peace, or even an exchange of prisoners, in order that his own liberty might be restored, Regulus advised them against either policy, returned to Carthage, and was brutally put to death. This story was probably invented in an attempt to justify the treatment of Carthaginian prisoners by the Romans.

Rehan, ADA (1860-1916). Irish-American actress. Born in Limerick, April 22, 1860, she spent

her childhood in the U.S.A., making her first stage appearance at Newark, N.J., in 1874. She first played in New York in 1875, and showed her versatility as a comedy actress in over 200 parts in Augustin Daly's company, 1879-99. Her famed roles chiefly on her Shakespearean parts, notably Rosalind, Portia, Cordelia, Desdemona, and Mistress Ford. She first appeared in London in 1884, returning in 1886, 1888, 1890, and 1893-95. Retiring in 1906, she died Jan. 6, 1916.

Rehearsal (Fr. *re*, again; *herse*, to harrow). Word applied, from its etymological significance of going over the same ground again, to the repetition of specific words, as when the catechist asks the candidate for confirmation to

Ada Rehan
as Rosalind

rehearse the articles of his belief, and in a secondary sense to a detailed relation of events. Specifically the term is given to the preliminary practice of a musical or dramatic work or of a ceremonial before its public performance.

Rehoboam. Jewish king. Son and successor of Solomon, his treatment of the tribes led to a revolt of all except Judah and Benjamin, and a division of the kingdom. He was author of the phrase, "My father chastised you with whips, but I will chastise you with scorpions." During his reign Judah was conquered by Shishak, founder of the XXIInd Egyptian dynasty (1 Kings 12 and 14; 2 Chron. 12).

Rehoboth. Town and dist. of the territory of S.W. Africa. The town is 60 m. due S. from Windhoek, at the head of the Great Fish River Valley. The dist. pop. of 5,000 is composed of European-Hottentot half-caste cattle breeders called the Bastards who had a native govt. until 1924, when the Bastard Administration, under the magistrate of Rehoboth, was set up. Gold has been worked since 1932.

Reich. German word meaning empire, corresponding to the English word realm. Part of the name of the Holy Roman Empire in its German version, it was adopted for the re-established empire of the Prussian kings, 1871, in the Weimar republic of 1919, and in the Nazi state of Hitler.

Reich, Das. Literary and philosophical quarterly magazine, founded in 1916 by Alexander Baron von Bernus. It ceased publication before the Nazis assumed power, and Goebbels revived the title in 1941 for a weekly. Nearly every week he wrote its main article. His articles were broadcast twice weekly over the whole German radio network. In his own evaluation, in his *Diaries* (1948) this weekly publication was the most important instrument of Germany's psychological warfare. It ceased to exist just before Goebbels committed suicide, April 30, 1945.

Reichenau, WALTER VON (1884-1942). German soldier. Reichenau was born at Karlsruhe, and joined an artillery unit in 1903. He served on the staff during the First Great War, and was made a field marshal in July, 1940, in recognition of his generalship during the campaign in the Low Countries and N. France. Reichenau commanded the German armies in the Ukraine

in 1941, and as an ardent Nazi he issued the notorious "No Pity" order, in which he commanded the German troops to be merciless in their dealings with Russian prisoners and civilians. On Jan. 17, 1942, it was officially announced he had died of a stroke, but, since he was reported to have opposed Hitler's strategy, some mystery attaches to the circumstances of his death.

Reichenbach. Name of four towns of Central Europe, the most important of which is in Saxony, in the Vogtland near the Thuringian border. It has an 11th century church with a famous organ, a house of the Teutonic knights, and was an important rly. junction and a centre of textile industry before the Russian occupation, then having a pop. of about 32,000. A second Reichenbach (Pol. Dzierżoniów), in Silesia, near Wrocław, was founded in the 16th cent., saw many battles in the Thirty and the Seven Years' Wars, and the Prusso-Austrian congress of 1790. It possesses a Gothic 16th century church, and it had a considerable textile industry before falling to Poland. Pop. (1935) 16,562. Two minor towns, one in Württemberg, another in Saxony, have less than 3,000 inhabitants each. There is a river Reichenbach in Switzerland, with waterfalls 1,000 ft. high, near Meiringen, in the Bernese Oberland.

Reichenbach, KARL, BARON VON (1788-1869). A German scientist. He was born at Stuttgart, Feb. 12, 1788, and early became interested in applications of science to industry, establishing the first charcoal furnaces and iron foundries to operate in Bavaria. He discovered paraffin in 1830 and creosote in 1832, and devoted much of his later life to the then fashionable subject of animal magnetism, claiming to have located what he called "odc force." He died Jan. 19, 1869.

Reichenberg or **LIBEREC.** Town of Czechoslovakia, in Bohemia. It is on the Neisse, 52 m. N.E. of Prague. The Rathaus, built by Neumann in 1888-93, is a fine example of the German Renaissance style, and the church of the Holy Rood dates from 1696. First known in 1348. It is an important industrial centre. Pop. 66,986.

Reichenhall. Town and health resort of Bavaria, Germany. It is picturesquely situated at a height of 1,550 ft. on the Saalach, 10 m. S.W. of Salzburg. The convent of S. Zeno, formerly an Augustinian monastery, was converted into

the convent school of the order of Englische Fräulein (English girls). The Romanesque church, dating from the 12th century, contains a relief of Barbarossa.

The saline springs, containing up to 24.5 p.c. of salt, are useful in rheumatism and pulmonary affections. They are the source of supply of Bavarian salt. An ingenious system of hydraulic machinery raises the brine over the mts., some of which are nearly 2,000 ft. high. It is conducted by an aqueduct from Berchtesgaden through Reichenhall to Rosenheim, 40 m. away. Pop. 12,000.

Reichsbank. National bank of Germany, the equivalent of the Bank of England. It was founded in 1875 to serve as a bank for the new empire, being based on the existing Prussian state bank. It had the power to issue notes and served the government as banker in various ways. Having been an instrument of Nazi financial policy, it was abolished in 1945, its functions in W. Germany being transferred to the Bank Deutscher Länder.

Reichsrat. Until 1806 the name of the German imperial government in consultation with the princes and estates. In tsarist Russia it was applied to a consultative body consisting of the grand dukes, the cabinet members, and a number of high officials appointed by the tsar. In imperial Austria it was the name of the upper and the lower houses of parliament, taken together. In Denmark (until 1866) and Sweden (until 1772) it applied to an aristocratic body of political influence, of medieval origin. In Bavaria, until 1918, it was the name for the house of peers. In the Weimar republic the Reichsrat, replacing Bismarck's Bundesrat, was the diet of the länder (states) in which the Prussian government held two-fifths of the total votes, Bavaria (during 1925-30) 10 votes only, Saxony seven, Württemberg four, Baden three, Hamburg, Hesse, and Thuringia two each, the ten other länder one each.

Reichstadt, NAPOLEON FRANÇOIS JOSEPH CHARLES, DUKE OF (1811-32). Son of Napoleon I by the emperor's second marriage, he was born in Paris, March 20, 1811, and, amid the rejoicings at the birth of an heir to the empire, was created king of Rome. On the fall of the empire, in 1814, Napoleon abdicated in his favour, but the Empress Marie Louise hastened with her child to Vienna, and no effort was made to establish his

right. Upon his mother becoming grand duchess of Parma, 1815, the lad remained in Austria, being expressly debarred from the succession to the duchy. In 1818 the emperor of Austria made him duke of Reichstadt. He died July 22, 1832. On Dec. 15, 1940, his remains were taken from Vienna to Paris and interred with those of Napoleon I in the Invalides. Rostand's play *L'Aiglon* (the young eagle), 1900, is written round the thwarted hopes and ambitions which embittered his life and hastened his death. As *L'Aiglon*, Sarah Bernhardt achieved one of her greatest successes. *Consult* The Duke of Reichstadt, E. Wertheimer, Eng. trans. 1905; Napoleon II, E. M. Oddie, 1923.

Reichstag (Ger., day of the realm). German parliament. It took its name from the informal and irregular gatherings of grandees and estates called for a given day, first by Frankish kings and later by German emperors. From 1663 to 1806 a permanent congress of envoys met at Regensburg (Ratisbon). As an elected parliament, the Reichstag was re-established in 1867 for the North German confederation, and in 1871 for the new German empire. It had at first 382, and from 1874 397 members. Together with the Bundesrat—the chamber of the German states, with votes allotted according to the size of the states—it exercised legislative power, but under prerogatives of the emperor.

After the 1918 revolution it became supreme. As a result of proportional elections, there were finally 647 deputies. The Reichsrat (*q.v.*) now corresponded to the former Bundesrat, but with curtailed powers and, together with the president, exercised a counterweight against the Reichstag. All men and women over 25 were eligible for election upon presentation by 500 signatures or by a group or party known to exceed that number of members. The Reichstag, although preserved in the Nazi system, was virtually abolished by Hitler, as he eliminated the opposition from the parliament elected in 1933, and submitted at later elections lists of Nazis only.

Reichstag Fire. The destruction by arson of the main parts of the German parliament building occurred on Feb. 27, 1933. For this a Dutch half-wit, van der Lubbe, and several German and Bulgarian Communists, among them the future Bulgarian premier G. Dimitrov, were indicted before

the high court at Leipzig. Subsequent investigations proved Nazi instigation to the plot, as a means of incriminating the Communists. During the trial in Oct. Dimitrov won a triumph over Goering, and with his fellow-countrymen secured acquittal; while van der Lubbe, apparently drugged, confessed and was executed. *See* Germany: History, pp. 3734 ff.

Reichswehr (Ger., realm defence). Name given to the army permitted to Germany by the treaty of Versailles, 1919. It was enlisted on a short-term voluntary and territorial basis and limited to a strength of 100,000. The name was retained for the conscript army developed under Hitler and fighting in the Second Great War.

Reid, FORREST (1876-1947). Northern Irish writer. He was born at Belfast, June 24, 1876, and educated there and at Christ's College, Cambridge. He wrote *The Bracknells*, 1911, and *Following Darkness*, 1912, novels which attracted the attention of E. M. Forster and other critics, who were impressed by his skill in evoking the atmosphere of childhood and adolescence, and encouraged him to continue writing, in spite of the apparent lack of success of his early books. Later novels were *Uncle Stephen*, 1931; *The Retreat*, 1936; *Peter Waring*, 1937; and *Young Tom*, which won the Tait Black prize in 1944. He also wrote critical studies of Yeats, 1915, and *De la Mare*, 1929, and volumes of autobiography, *Apostate*, 1926, and *Private Road*, 1940. He died at Belfast, Jan. 4, 1947.

Reid, THOMAS (1710-96). Scottish philosopher. Born at Aberdeen, April 26, 1710, and educated there, he was professor at Marischal College, 1752-64, and subsequently at Glasgow. In 1743 he published his *Essay on Quantity*.

In later works Reid showed himself the originator of the so-called philosophy of "common sense," meaning thereby the beliefs which all rational beings have in common. He was opposed to Berkeley's idealism, according to which we do not really perceive any external things, but only ideas. This, he taught, is bound to lead to scepticism and can be combated only by the conviction that nature affords us an immediate certainty

of our own existence and of that of sensual external things. Common sense embodies fundamental truths, independent of experience. Reid died Oct. 7, 1796.

Reid, THOMAS MAYNE (1818-83). British novelist. Born at Ballyronney, Co. Down, N. Ireland, April 4, 1818, the son of a Presbyterian minister, he emigrated to America in 1839. He saw life in many phases and served in the U.S. army in the Mexican War of 1847. His experiences are embodied in a long series of stirring novels of adventure, among which the best known are *The Rifle Rangers*, 1850; *The Scalp Hunters*, 1851; *Afloat in the Forest*, 1865; and *The Headless Horseman*, 1866. Mayne Reid returned to Europe in 1849 and, except for a brief interval in America, lived in England until his death, Oct. 22, 1883.

Reid, WHITECLAW (1837-1912). American journalist, author, and diplomat. Born at Xenia, Ohio, Oct. 27, 1837, during the Civil War he represented the *Cincinnati Gazette* as war correspondent. In 1869 he entered the office of the *New York Tribune*, of which he afterwards became editor and chief owner. Minister to France, 1889-92, in the latter year he was an unsuccessful Republican candidate for the vice-presidency. Twice special envoy to England, at the diamond jubilee of Victoria, 1897, and the coronation of Edward VII, 1902, he was appointed ambassador to Great Britain in 1905. He died in London, Dec. 15, 1912. He wrote *American and English Studies*, 1914.

His son, Ogden Mills Reid (1882-1947), after practising as a lawyer, joined the *New York Tribune* as a reporter, and eventually became editor. In 1924 he bought the *New York Herald*, and combined the two papers as the *New York Herald Tribune*, making it one of the most influential papers in the U.S.A. He died Jan. 4, 1947.

Reid Report. Report of the committee on coal mining set up under the chairmanship of Sir Charles Reid. Issued as a white paper on March 28, 1945, it advised immediate and rapid modernising of the industry and the sinking of new shafts. Its main recommendations were: (1) reorganization and mechanisation

T. Mayne Reid,
British novelist

Thomas Reid,
Scottish philosopher

of coalfields on a regional basis, all pits in each area to be under compact and uniform management; (2) creation of a central authority, with statutory powers, to conserve national coal resources. A working week of five 8-hour days; proper recruiting and training of miners, with greater opportunities for advancement; wages equal to those in industries demanding similar skill and effort, were also recommended. Many of the proposals were adopted by the national coal board when the mines were nationalised in 1947. Reid became a member of this board, but resigned in 1948.

Reigate. Mun. borough and market town of Surrey, England. It stands beneath the North Downs, 23 m. S. of London, and is served by electric rly. from London, by steam rly. from Guildford, and by Green Line, being an important road junction on the main London-Brighton road. The chief church is that of S. Mary Magdalen, mainly Perp., but with fine transitional Norman arcades in the nave. Lord Howard of Effingham is buried here. Other buildings include the town hall, market house, and a grammar school dating from 1675. There are numerous caves beneath the town. Reigate is the centre of a considerable agricultural trade; an annual fair is held.

The town grew up around a castle built and held by the Warenne family, from whom it passed to the earls of Arundel. The castle was destroyed after the Civil War, the mound of the keep, 50 ft. high, being all that remains, and the grounds are now a public garden. There was also a priory here in the Middle Ages. From 1295 to 1832 Reigate sent two members to parliament; thence till 1867 it sent one; since 1950 it gives its name to a county constituency. It was made a borough only in 1863, although some of the rights are much older. In 1921 H. Somers Somerset, of Reigate Priory, presented market and other rights. The borough includes the adjoining town of Redhill (*q.v.*). Pop. 40,538. *Pron.* Rye-gate.

Reign of Terror. Term applied to the period of the French Revolution during which supreme power was in the hands of the committee of public safety. *See* Terror, The; also French Revolution; Jacobins; Robespierre.

Reilly, Sir Charles Herbert (1874-1948). British architect. He was educated at Merchant Taylors' school and Queens' Cam-

Sir Charles Reilly,
British architect

distinguished in Great Britain, and in 1947 a fund was opened for the establishment of an annual Reilly scholarship. He designed many notable buildings, including the Liverpool students' union, the mission church of S. Barnabas, Dalston, and Devonshire House, Piccadilly (the last-named with Thomas Hastings). He was elected to the council of the R.I.B.A. in 1909, became architectural editor of *Country Life* in 1922, and was the first to advocate chaining off specified streets for children's play. He was founder and later vice-chairman of the Liverpool repertory theatre (Playhouse). Knighted in 1944, he died Feb. 1, 1948. His autobiography, *Scaffolding in the Sky*, appeared in 1938.

Reims or Rheims. Town of France, in the dept. of Marne. It lies on the right bank of the Vesle, 99½ m. by rly. (*via* Soissons) E.N.E. of Paris. It is an important rly. centre, and is linked by canal with the Aisne and the Marne. E. of the town stretches part of the plain of Champagne; to the S.W. rises the vine-covered Montagne de Reims. The main activities are the champagne industry, of which this is the centre, and the manufacture of woollens, cashmeres, merinos, flannels, etc. Reims is the seat of an archbishop. Pop. 110,749.

The cathedral was founded in 1211, but stands on the site of earlier churches, the last destroyed by fire in 1210. It is one of the noblest Gothic buildings of France. The choir was completed in 1241, and the W. façade, with its three portals with over 500 statues, also in the 13th century. The whole was completed in 1428, but the spires were destroyed by fire in 1481. The rose

bridge. From 1904 to 1934 he occupied the chair of architecture at Liverpool university. He made the school of architecture there one of the most

window over the W. portals, the beautifully carved N. portal, and the twin W. towers, 267 ft., are among famous features of the exterior. Bombardments of 1914-18 severely damaged the cathedral.

Reims arms

and reopened July 10, 1938.

In the First Great War the archiepiscopal palace (15th-17th century, with a 13th century chapel) was destroyed by fire; the fine 17th century town hall was gutted; the noble abbey church of S. Remi, 12th-15th century, and founded in the 6th century, was severely damaged. The Roman *Porte de Mars*, 4th century, still stands, but the *Hôtel Dieu* was destroyed, and the 13th century *Maison des Musiciens* demolished by shell-fire, though its famous statues were preserved.

Reims was an important Roman centre, known as *Durocortorum*. S. Remigius, bishop 459-533, baptized the Frankish king Clovis here, 496. From 987 Reims was the scene of the coronation of all French kings but six, and the archbishops acquired great po-

Reims. West front of the cathedral before it was damaged during the First Great War. The restored cathedral was reopened in 1938

litical importance. From 1420 it was held by the English, being recovered by Joan of Arc in 1429. It was captured by Marmont, 1814; by the Prussians, 1870; and was in German occupation, Sept. 4-12, 1914, at the height of the German advance which marked the opening of the First Great War; and until Oct., 1918, was under constant bombardment from German guns on the hills to N. and E. (See Marne, Battles of the.) In the Second Great War Reims was the h.q. of the British advanced air striking force from autumn, 1939, until May, 1940; and on June 10 was again entered by German troops. The city, little damaged, was liberated Aug. 30, 1944, by units of the U.S. 3rd army without firing a shot; the restored cathedral was intact. At Reims Gen. Eisenhower (q.v.) set up his h.q. in the last months of the Second Great War in Europe; and here on May 7, 1945, Col.-Gen. Jodl, chief of staff of the German army, signed Germany's unconditional surrender to the Allied expeditionary force and the Soviet high command.

Rein (ultimately from Lat. *retinere*, to hold back). Controlling or guiding strap or cord attached to the bit of a ridden or driven horse. Either of the handles of a blacksmith's tongs is also called a rein. In the plural the word is used in such phrases as the reins of government, to express control. The reins (Lat. *renēs*) is also another word for the kidneys. In architecture, the reins of a vault are the parts between the crown and abutment. See Driving.

Reincarnation. Term meaning the assumption of human nature more than once. It is used to describe the process involved in the theory known as metempsychosis or the transmigration of souls, which maintains that all personalities or types of being (including animals) enter into life upon the plane of earth, not once but many times, and assume different forms at every reappearance. According to an ancient Buddhist book, a man, according to his deeds, may be reincarnated (a) among the evil spirits in hell, (b) as an animal, (c) as a spectre or ghost, (d) as a man, (e) as an inhabitant of one of the seven realms of Heaven.

Plato, in the Republic, discusses in the form of an allegory the principle on which the condition of the reincarnate life is determined. Each soul draws its destiny by lot. If the lot determines that he shall be a king, for instance, the choice as to whether he shall be a good or bad king rests with himself. In the Phaedrus, however, he leaves less to chance. The soul which has seen most of truth comes to birth as a philosopher, that which has seen truth in the second degree as a righteous king, the next as a politician, the next as a gymnast or physician, the next as a prophet, the sixth as a poet, the seventh as an artisan, the lowest of all as a tyrant or demagogue. See Transmigration.

Reindeer (*Rangifer*). Species of deer. Found in N. Europe, Siberia, Newfoundland, Canada, and the United States, it is the only deer that has been successfully domesticated. In former times it had a considerably wider range, and its remains are not infrequently found in both Great Britain and France. It is notable for the fact that both sexes bear antlers.

Placed higher on the forehead than in other deer, they are very long and curved, and bend forward as they approach the tips.

Reindeer. Male of the North European species of deer
W. S. Berridge, F.Z.S.

The extremity in some of the varieties is broadly palmated, and there is a conspicuous brow-tine, which is usually branched and sometimes palmated. This brow-tine is placed very low and often descends in front of the face. The feet, remarkable for their breadth

and great spread, are specially adapted for travelling on snow in winter and boggy land in summer.

The reindeer is heavy in body and comparatively short in limb; the face is long and straight, the ears short and shaggy, and the hair of the pelt is somewhat long. In colour it is usually brown, with white on the neck, underside, and inner flanks; but the colour varies greatly in domesticated specimens, which are often grey or whitish. In height the reindeer ranges from 3 ft. 8 ins. to 4 ft. at the shoulder in Europe, but it has been known to attain a height of 5 ft. in Canada.

The European reindeer occurs from Scandinavia to E. Siberia, but in many districts it is now very rare in the wild state. It has been domesticated from an early period, and it is the beast of burden in Lapland and in parts of Norway and Siberia. In the wild state it spends the summer in the grassy valleys, and moves in winter to the mountains. The American type of reindeer is commonly known as the caribou (q.v.). See Ice Age; Sledge.

Reindeer. Lake and river of Canada, mainly in Saskatchewan. The lake is in the N.E. of the prov., receives the Cochrane from the N., the Vermilion from the W., and is dotted with islands and islets. Its outflow is at the S. end by the Reindeer river, which flows almost due S. to join the Churchill.

Reindeer Moss (*Cladonia rangiferina*). Lichen or compound plant. It consists of an ascomycetous fungus and an alga in symbiotic association. It is found in abundance on heaths and hills, often in N. Europe covering vast tracts. It is a more or less erect, pale-grey plant, much branched, the ultimate divisions being pairs of short, drooping threads. It

Rein. Methods of holding driving reins. 1. Single harness. 2. Tandem. 3. Military hold for four horses. 4. Four in hand

forms a valuable food for cattle and reindeer in Lapland and other northern countries. See Lichen.

Reinforced Brickwork. Brick walls, the lateral strength of which is increased by the use of wire mesh, spread along the bed of the brickwork course at intervals.

Reinforced Concrete. Concrete reinforced by metal to take up tensile stresses and to strengthen the resistance of the material. See Concrete.

Reinhardt, MAX (1873-1943). Austrian-born American theatrical producer. Born of Jewish stock at Baden, near Vienna, Sept. 9, 1873, his real name being Goldmann, he began to study acting at 17, and soon became well known as a character actor at the Deutsches Theatre, Berlin, later achieving great success there as a producer. After directing at the Neues Theatre, he returned to the Deutsches as director, giving international fame to the German stage. He directed memorable productions of Aeschylus, Sophocles, Ibsen, Strindberg, and Calderon. In 1906 he took over the direction of the Kammerspielhaus, an intimate playhouse which served as annexe to the Deutsches. He made his reputation in Britain with *The Miracle*—a medieval pageant lavishly produced at Olympia, London, 1911.

A spectacular production of Oedipus Rex was given at Covent Garden the following year. Another notable production was *Sumurun*, a play without words. After the First Great War Reinhardt remained the leading figure of the German stage, until in 1933 he was dismissed by the Nazis. He then left Germany and settled in the U.S.A., directing in 1935 a film version of *A Midsummer Night's Dream*. He became a U.S. citizen in 1940, and died at New York, Jan. 10, 1943.

Reinhardt attempted to bring the playgoer as close as possible to the play. He increased the mechanical resources of the theatre and improved its craftsmanship at a time when naturalism was slavishly exact. His most acclaimed productions were those in which hundreds of performers took part, such as *The Miracle*, and Oedipus Rex, but it was in his productions at the Deutsches Theatre during

1905-10 that his inventive genius was most marked.

Reisner, GEORGE ANDREW (1867-1942). American Egyptologist. Born at Indianapolis, Nov. 5, 1867, he was educated at Harvard, and, after work in Berlin, became lecturer in Egyptology and director of the Hearst Egyptian expedition from the university of California during 1899-1905, leading a joint expedition sent by Harvard and Boston museum in the latter year. He conducted excavations at Samaria, 1909-10, and in 1927 published a preliminary report on his discovery at Giza of the tomb of Queen Hetepheres, a more complete account being published in 1932. Professor of Egyptology at Harvard from 1914, and curator of the Egyptian dept., Boston Museum, from 1910, he died June 6, 1942.

Reith, JOHN CHARLES WALSHAM REITH, 1ST BARON (b. 1889). British administrator. Educated at Gresham's school, Holt, and Royal Technical college, Glasgow, he became an engineer. During 1916-17 he was in charge of contracts placed in the U.S.A.

for munitions for Great Britain. In 1922 he was the first general manager of the B.B.C., then its director-general during 1927-38. He was successful in impressing upon British broadcasting during its formative years the mark of his own strong personality, insisting always on the maintenance of high intellectual and spiritual standards. An annual series of broadcast lectures, called Reith lectures after this pioneer of the B.B.C., was established in 1947.

Chairman of Imperial Airways before the Second Great War, Reith took a similar position with B.O.A.C., 1939-40, becoming M.P. for Southampton in the latter year, when he was successively minister of Information, and minister of Transport. During 1940-42 he was the first minister of Works and Buildings (the title later being altered to minister of Works and Planning). He was afterwards for a time director of Combined Operations, Material dept., at the Admiralty, and then made a 45,000 m. air tour to discuss the future organization of Commonwealth radio and cable systems. In 1946 he was elected

chairman of the Commonwealth communications council. Knighted in 1927, he was raised to the peerage in 1940. He published his autobiography, *Into the Wind*, 1949.

Reitsch, HANNA (b. 1912). German airwoman. Giving up medical training for flying, in the 1930s she broke records for gliders and in 1938 piloted a glider for 150 m. During the Second Great War she acted as a test pilot. Volunteering to make an experimental flight in a flying bomb, she was seriously injured. For this exploit she received the Iron Cross, first class. On April 26, 1945, she flew into Berlin with a helicopter, taking Gen. von Greim, then head of the Luftwaffe, to Hitler. Two days later she succeeded in taking him out again, being one of the last persons to see Hitler. Her account of the last days in the Chancellery shelter was an important historical source.

Reitz, DENEYS (1882-1944). S. African politician. A son of F. W. Reitz (1844-1934), president of the Orange Free State, 1889-96, and president of the first senate of the Union of South Africa, 1911-18, he was born at Bloemfontein, and educated there. He fought against the British in the S. African War, and went into exile with his father. Returning later to S. Africa, Reitz became a lawyer. At the outbreak of the First Great War he joined Botha, serving in the German W. Africa campaign, and later in Flanders. Elected to the legislative assembly in 1920, he was minister of Lands in Smuts's government, again serving in the same capacity in 1933. Two years later he was minister of Agriculture and in 1938 minister for Native Affairs and deputy prime minister, retaining the latter post until 1943. In 1942 he was appointed high commissioner for S. Africa in London. He died Oct. 19, 1944. His wife was the first woman member of the Union parliament.

The story of Reitz's varied career is told in his books, *Com-*

mando, Trekking On, and No Outspan.

Réjane, GABRIELLE CHARLOTTE (1857-1920). French actress. Born in Paris, June 6, 1857, her real name being Charlotte Réju, she made her début at the Odéon,

Max Reinhardt, theatrical producer

Lord Reith, British administrator

Mme. Réjane as Catherine in *Madame Sans-Gêne*

1875, and made a marked success at the Vaudeville in the same year. She was an actress of great versatility and disciplined technique, and made a memorable appearance as Catherine in *Madame Sans-Gêne* at the Gaiety Theatre, London, 1894, and in New York, 1895. The *Théâtre Réjane*, Paris, was opened in 1905, and in 1909 she toured S. America. She played at intervals in London, 1906-15, acted in film versions of her plays, and died on June 14, 1920.

Rejected Addresses. Series of English parodies. Published in 1812, it purported to be the compositions of the most popular poets of the day submitted for a prize offered on the occasion of the inauguration of the New Drury Lane Theatre. The authors were Horace and James Smith (*q.v.*), the former's best efforts being the parodies of Byron and Scott, the latter's the parodies of Cobbett and Crabbe.

Rejuvenation. The theory that life can be prolonged by the replacing of the worn-out testicular or ovarian glands with young, healthy glands obtained from the higher monkeys. It was first advanced in 1910 by Serge Voronoff (*q.v.*). It was, however, found that the transplanted glands perished in the new host. A more successful operation was introduced by Doppler of Vienna. He increased the blood supply of

the sexual glands by diverting the blood stream more richly to them.

Relapsing Fever. Acute fever caused by infection by a spirochaete. Different forms of the parasite occur in Europe, America, Asia, and Africa, and cause differences in the symptoms. The European form is met chiefly in Russia, while epidemics of the disease have occurred in the past in the British Isles. The period of incubation is believed to be about seven days.

The onset may be gradual or sudden, with severe headache, shivering fits, pains in the back and limbs, and rise of temperature. The liver and the spleen become enlarged. At the end of about a week the temperature suddenly falls, and the other symptoms disappear. In three or four days to a week, however, the symptoms recur, though the second attack may not be so severe as the first.

After recovery there may be a further relapse, and it is this characteristic which has given the disease its name. The great majority of cases recover, but in a small number complications, such as pneumonia, bronchitis, or haemorrhage, may arise and terminate fatally. The treatment is that of the group of diseases caused by the spirochaete; salvarsan, penicillin, and the sulphonamide group of drugs have been found useful.

NEWTONIAN OR CLASSICAL RELATIVITY. When Newton formulated the laws of dynamics he had to assume certain properties of space and time—the background against which the motion of bodies had to be considered. The assumptions he made were extrapolations from what might be the “common sense” outlook and were:

(1) There is a uniform even-flowing universal time, and all observers (whatever their state of motion) observing two events taking place and measuring the time interval between their occurrences will find the same interval.

(2) Similarly if they measure the distance between the points where the events occurred they will find the same distance.

The Newtonian Principle

These two postulates, with Newton's laws of dynamics, led to the Newtonian principle of relativity. If one observer ascertains from his experiments that Newton's laws of dynamics are correct any observer moving relatively to him with constant speed and along a straight line will also deduce from his experiments that they are correct.

For example the pendulum of a clock will swing in just the same way on a smoothly moving train or boat as in a house. If there are accelerations (jerks) it will, however, behave differently. The principle of relativity allows one to deduce what in fact the behaviour of the pendulum will be if the peg is not moving with constant speed in a straight line but, say, compelled to move in a circle. This is of course just the case of a pendulum on the earth and the behaviour of the pendulum may be used to demonstrate the earth's rotation (Foucault's pendulum). Centrifugal forces, etc., may thus be calculated.

It will be seen that Newtonian relativity can be used to compare the observations of any two observers, whatever their state of motion, but that its applicability is restricted to dynamics. It is this restriction which eventually led to its downfall.

DIFFICULTIES OF NEWTONIAN RELATIVITY. During the 19th century the work of Faraday, Maxwell, and Hertz established that light was an electromagnetic wave. The propagation of light through empty space, together with the desire to have a medium in which the wave motion could take place, led to the ether hypothesis. According to this there is an all-pervading massless

RELATIVITY: TIME, SPACE, AND MATTER

H. Bondi, Lecturer in Mathematics, Cambridge University

This article, which gives a general account of the Theory of Relativity, should be read in conjunction with those providing details of individual aspects of the subject: Geometry; Gravitation; Matter, etc. See also biographies of the scientists concerned: Einstein; Newton; Riemann.

The principle of relativity is the term applied in physics to a statement of the laws which determine how the results of experiments depend on the experimenter's state of motion, *e.g.* these laws should explain how experiments (say, measurements of the time-keeping of a clock) carried out on a merry-go-round should differ from similar experiments carried out on the ground.

The principle is of great importance to physics for two reasons:

(1) All experiments are, in effect, carried out on a merry-go-round, *viz.* the earth. Unless we know clearly how the earth's motion affects their results we cannot state any intrinsic laws or apply them to any subject not dealing with the earth's surface.

(2) Modern physics is greatly concerned with fast-moving par-

ticles. Now while we know from experiments how various forces affect slow particles, the only way we can apply this knowledge to fast particles is to imagine an observer travelling with the particle. To this observer the particle would seem to be still, and he can apply the knowledge gained with slowly moving particles to this fast particle, thus determining the forces acting on it. But the knowledge acquired by this imaginary observer is useless to us unless it can be translated back to the real observers, and the principle of relativity is required for this translation. In order to explain the great changes in our knowledge of the laws of relativity it is desirable to consider the views held before the beginning of this century. The following laws were then assumed to be correct:

substance, the ether, in which this wave-motion takes place. The waves are propagated through this medium at a finite velocity, the velocity of light, which had been long before determined by Römer.

The ether must be assumed to be quite unaffected by the motion of material bodies, for otherwise there would be strange refraction effects near the moon and the planets. These are not observed.

Since light is propagated in the ether with the same velocity in all directions an observer moving through the ether should find that light is propagated more slowly in front of him than behind him, so that he will observe an "ether wind."

Ether Wind Disproved

This was not a particularly agreeable concept, but it was a clear and logical consequence of Maxwell's equations of electromagnetism, even, it could be shown, without the ether hypothesis. Therefore surprise was considerable when the Michelson-Morley experiment (1886) proved the non-existence of the ether wind. Theories proposed to explain the absence of the effect assumed that motion through the ether altered the lengths of all material bodies, including measuring rods, so that the velocity of light always appeared to be the same in all directions (Fitzgerald contraction). Lorentz found the full code of translation from one observer to another in relative constant velocity straight line motion. This reduced to the Newtonian code for slow motions (dynamics), but gave the right answer for high velocities (light). These formulae constitute the famous Lorentz transformations, which replaced the Newtonian formulae. The reason for the breakdown of the "obvious" Newtonian relativity remained obscure. The situation was highly unsatisfactory until 1905.

SPECIAL OR RESTRICTED THEORY OF RELATIVITY. In that year Einstein showed that the Newtonian concepts of a uniform even-flowing time and an absolute space lacked physical relevance.

His argument was based on the fact that nothing is known that travels faster than light. Hence if two moving observers wish to communicate with each other in order to synchronize their clocks, compare their standards of length, etc., their speediest way of doing so is by electromagnetic waves. Although the speed of light is great it is not infinite, and Einstein

could easily show that for fast moving observers this method of signalling did not allow them to connect their space and time reckonings sufficiently well to establish the same time and space scales. However, the standard velocity of signals, the velocity of light, would appear to them to be the same, just as the Michelson-Morley experiment had shown.

Einstein thus proposed a new principle of relativity. If Maxwell's equations of electromagnetism and certain simple laws of dynamics were correct for some observer, then the same laws would hold for any other observer moving relatively to the first in a straight line with constant velocity. It follows that the correct laws of transformation are those proposed by Lorentz and that what were called above "certain simple rules of dynamics" were laws which hardly differed from Newton's for small velocities, but differed appreciably for large ones.

Space-Time Combination

For two events taking place at two different places, according to Newtonian relativity, all observers will agree on the distance between the two points and on the time interval between the two events. This is not so according to the Lorentz transformations. The order of occurrence of the two events may even appear to be different to different observers. However, though neither spatial distances nor time intervals are sacrosanct, a certain combination of the two will appear the same to all observers. The reason for the existence of this invariant combination is simple. While time is partly a subjective quantity defined by each observer for his own convenience, it has also an objective meaning in the history of each particle. It is an objective fact that a certain train left King's Cross before it arrived at York, and all observers must agree on this. Now consider again two events at different places. Light from one event may reach the place of the other event before, during, or after the occurrence there of this second event. Which of these is true is an objective fact on which all observers must agree, being described by the invariant combination of distance and interval. Since no effect can travel faster than light this means that the causal order is preserved.

The real significance of this intermingling of space and time was first pointed out by Minkowski. The three dimensions of space

appear different according to the way one is facing, while distance, computed from all three, does not depend on which way one is looking. This fact is stated as the three dimensional nature of space.

Similarly, as Minkowski stressed, time interval and distance depend on one's state of motion, but their combination does not. This limited convertibility of space and time may be stated as the four-dimensional nature of space-time. To speak of a fourth dimension does not denote anything mystical which one cannot "imagine," but is simply a way of stating the experimental fact that measurements of both time intervals and spatial distances are affected, in a certain linked way, by the state of motion of the observer.

Effect of Velocity On Mass

The meaning of the Lorentz transformations may be illustrated by considering the addition of velocities. Imagine the configuration consisting of an observer, a particle which he observes to be moving away from him with a certain velocity, and a second observer moving away from the first one with a different velocity in the opposite direction. How fast does the particle appear to be moving to this second observer?

According to Newtonian ideas, with a velocity equal to the sum of the two velocities mentioned, but according to Einstein and Lorentz, with a somewhat smaller velocity. As long as both the particle and the observer move slowly it is little less than the sum. If, however, either of them moves nearly as fast as light, the observed velocity will be much smaller, so that in no case can it exceed the velocity of light.

This impossibility of exceeding the velocity of light shows itself in an increasing resistance of matter to further acceleration when it is already moving fast. This increase of inertia (or mass) with velocity has been confirmed by experiment. It is, for instance, noticeable in atom-splitting machines. If electrons are given an energy of one million volts they move at 95 p.c. of the speed of light, and their masses are three times as great as when they are at rest. At five million volts they are only slightly faster (99.6 p.c. of the speed of light), but they are 11 times as massive as when at rest.

Einstein was able to show that the equations of dynamics and electrodynamics could be brought into this relativistic four-dimensional form with changes which were small for small velocities but

gave the right result for large velocities. This four-dimensional formulation has been confirmed experimentally. An important result is that mass represents energy, the conversion factor being the square of the velocity of light. The great magnitude of this factor indicates that even a moderate mass represents a tremendous accumulation of energy. If a body loses energy (e.g. by radiation) it also loses mass.

The experimental verification of the special theory of relativity are so complete that it is universally accepted. It covers electromagnetism and a large part of dynamics, but has two severe limitations: (1) it applies only to observers in uniform straight line motion; and (2) it does not include gravitation.

These two deficiencies soon led Einstein to look for a wider principle. The difficulties of formulating such a principle are evidently great. It is clear from everyday life that relatively accelerated observers have different experiences. The jerk experienced in a sharply braking train or car, the centrifugal force experienced when quickly rounding a corner, all bear evidence that relatively accelerated observers experience different forces. Accordingly, a general theory of relativity cannot postulate that the experiments of two mutually accelerated observers should have the same results, but can only require that the laws of nature discovered by our two observers should be the same in form. This formal equality should provide tests which any observer can apply to decide whether space is empty or not, to show that energy (mass) is conserved, etc.

Clearly these universally applicable tests had to be devised in such a way that they eliminated the effects of the observer's accelerations. Now the effects of jerks are well known in Newtonian dynamics, where they appear as additional forces, due to the motion of the observer and his system of reference. All these forces have an important property in common. They are proportional to the mass of the body on which they are acting. The reason for this is simply that all free bodies move (in the absence of gravitation) with constant speed along straight lines. Hence they all appear to the accelerated observer to have the same acceleration.

This property shared by all these apparent forces is common also to

one other force: gravitation. The equality of inert and gravitational mass (which is the reason why all bodies fall equally fast) had been known since the time of Galileo, and had been verified by Eötvös with very great accuracy. No explanation was given until Einstein expressed the view that gravitation, like centrifugal force, was due to the choice of one's system of reference. The natural observer, he said, was a freely falling one, not one held up by a complicated structure like the floor. Such a freely falling observer would not see any action of gravity in his neighbourhood since all other bodies would fall at the same speed. But it is more difficult to see how he should deal with distant objects falling differently. Einstein showed how this difficulty could be overcome by adopting a system of geometry slightly different from the Euclidean one, viz. the system investigated by Riemann (*q.v.*).

GENERAL THEORY OF RELATIVITY. In 1916 Einstein showed how to use this geometry so that any two observers, irrespective of their states of motion, could formulate the laws of nature in the same way, eliminating the influence of all jerks and of gravitation. These Newtonian forces were replaced by new concepts. Gravitation was no longer a force governed by Newton's famous inverse square law, but a deviation of the geometry of space-time from the Euclidean one, a so-called "curvature of space," which was due to the presence of matter. In this space-time the orbits of particles and light rays are determined by the simple requirement that they should be shortest distances (which are not straight lines in the presence of space curvature).

Verification by Observation

Newton's law of gravitation had been a fundamental law applied and tested in great detail in the solar system. It was now replaced, not by another law of force, but by something radically new, a "geometrisation" of dynamics. However, the new law gave almost the same planetary orbits, etc., as the old ones. Attention was immediately focused on the minute differences between the old and the new predictions and it was found that three of these should be just observable, viz. (1) light rays grazing the sun should be deflected by an angle of $1.9''$ (relativity) instead of at most $0.9''$ (Newton); this effect can be observed only during a solar eclipse; (2) the elliptical orbit of the planet

Mercury should appear to rotate very slowly ($0.44''$ per year) about the sun (relativity) instead of being fixed (Newton); and (3) light emitted by atoms on the surface of the sun should, according to relativity, appear to be very slightly redder than light from similar atoms on the earth.

All three effects have been verified observationally, the first one most spectacularly by the solar eclipse expeditions sent out in 1919 for this purpose by the Royal Society at the instigation of Sir A. S. Eddington. However, the effects are so near to the limits of the instruments used that the observational errors are not very much smaller than the effects measured.

The general theory of relativity has gained wide, though not universal, acceptance. It has been applied with some success to the theory of the universe as a whole, and in 1950 was further generalised by Einstein to include electromagnetic as well as gravitational forces in a unitary field theory.

A different school of thought, led by E. A. Milne, has rejected general relativity and developed a new approach called kinematical relativity. So far, however, no experimental method has been devised for testing these later theories. *Consult* Space, Time, and Gravitation, Sir A. S. Eddington, 1920; *The Theory of Relativity*, A. Einstein, 1920; *Space-Time—Matter*, H. Weyl, 1922; *The Evolution of Physics*, A. Einstein and L. Infeld, 1938.

Relativity of Knowledge.

Theory, variously formulated, that knowledge is only relatively true. (1) Positive knowledge is impossible, owing to the ever-changing nature of the data of sense; we do not know things as they really are, but only as they appear to us. This is the doctrine of Protagoras: man is the measure of all things; all knowledge is relative; each thing is for each man as it appears to him. (2) Our knowledge of particular things depends upon the relations in which they stand to other things. (3) In psychology, the view that sensations possess importance only when related to other simultaneous or immediately previous sensations in the mind.

Relator. English law term. An action will lie at the suit of the attorney-general for a tort (generally a nuisance) of a public character, but the attorney-general proceeds not by writ but by information (*q.v.*); and he proceeds

either of his own motion, or is set in motion by someone who really brings the action himself, but procures the attorney-general's consent to use his name. Such a person is called the relator.

Relay. Device in electrical engineering, by means of which a weak current can be made to control a strong one. It was first used on long telegraph lines which were divided into sections, the faint signals at the end of each section operating a delicate electromagnet which attracted a moving iron armature that opened and closed contacts which repeated, or relayed, the signals along another section.

Many hundreds of different types, operated in many ways—electromagnetic, thermal, induction, gas-pressure, etc.—have been developed for particular purposes, all having the same basic principle that, when a current is passed through the operating circuit, the moving contacts close (or open) either one or a number of associated circuits, instantaneously or with some form of time delay. The relay is the basis of all automatic control; e.g. an automatic telephone exchange uses thousands of relays in its complicated switching operations. On an electric power transmission system, "protective" relays, by operating circuit breakers, isolate faulty sections of the system. *See* Circuit, Electric; Remote Control.

Relay Race. In athletics, a race in which several runners compete on either side, each covering a certain distance, his place being at once taken by a succeeding runner, until the tape is reached. The idea was possibly derived from the torch-race (*lampadēdromia*) of the Greeks, in one form of which the runners passed on a lighted torch to a waiting comrade. Nowadays a baton is handed on. A similar procedure is sometimes adopted in cycling and swimming; in the latter each swimmer starts as his predecessor touches an end line.

Release. Term used in English law to describe the discharge of any right on any action. A release of a debt is an extinguishment of the debt, thus differing from a receipt, which is merely *prima facie* evidence of payment. A release may be of a right of property; as where a partner, on retiring, releases all his rights in the partnership property to the remaining partners; or where a lessor releases to the lessee the reversion expectant on the termination of the lease. *See* Receipt.

Relic (Lat. *reliquiae*, remains). In a religious sense, the body or part of a body of a saint or martyr, or some article, such as clothing, associated with a saint or martyr, preserved as an object of devotion or veneration. Generally, the word implies that which is left of an object after the loss or decay of its other parts, as a souvenir of one who is dead. Examples of religious relics are the remains of holy men preserved in churches or shrines: fragments supposed to have belonged to the true Cross (*q.v.*); and the Holy Coat of Treves (*q.v.*). Veneration of Christian relics began about the 4th century; it received marked impetus during the crusades; its persistence is exemplified by the search at Glastonbury for the Holy Grail (*q.v.*), or cup which held the wine blessed at the Last Supper; a strong reaction set in against it at the Reformation, and it is condemned by Article xxii of the English Prayer Book.

Burial places of martyrs were chosen by the early Christians for their meetings or services. Later, churches were built over the remains; and at one time consecration of a church was dependent upon the possession by that church of some holy relic. Gradually relics came to be associated with miracle working. Desire for the possession of them inspired the secret and fraudulent removal of remains from one church to another. In 1215 the fourth Lateran Council forbade relics to be sold or exposed outside of their cases or shrines, and prohibited veneration of relics until their authenticity had been decided by the pope. The custom, virtually unknown among the Jews, is common to both Roman and Greek Churches. *See* Altar: Miracle; Shrine; Worship of the Dead.

Relief (Lat. *relevare*, to raise up). Literally the removal of an evil. It is frequently used in connexion with distress arising from unemployment and the like. Relief works are works of a public character, like construction of arterial roads, undertaken to provide employment in times of distress. The word was used in connexion with the administration of the poor laws, as in the phrases outdoor and indoor relief. (*See* Poor Law.)

A relief map is one on which the form of the country is indicated by some conventional method such as the layer system. *See* Map.

Relief. In the feudal sense, a payment made by a tenant to his lord on taking possession of an estate held under him. Feuds

originally gratuitous, were also precarious, and held at the will of the lord, but as a more permanent degree of property was introduced, they began to be granted for the life of the feudatory, although they were not hereditary. When feuds became hereditary, the relief was continued on the death of a tenant, although its original foundation had ceased. Being at first arbitrary and at the discretion of the lord, who by demanding an exorbitant payment could in effect disinherit the heir, reliefs were regarded as one of the great grievances of tenure. William the Conqueror therefore fixed the relief at a certain quantity of arms and habiliments of war, and in the reign of Henry II a composition of 100 shillings was universally accepted for every knight's fee, until relief was abolished together with other feudal anachronisms. *See* Feudalism; Land.

Relievo. Italian term for the sculpture in relief used in the decoration with figure compositions of walls and other flat surfaces. The Greeks and Romans practised this kind of sculpture in its simpler forms. Some later Hellenistic work shows the introduction of pictorial or perspective treatment, i.e. relief with differences in plane, and the commemorative columns erected in imperial Rome were a distinct effort after perspective effect. This art, however, made little progress during the Middle Ages. Donatello's John Baptist on the font at Siena, completed in 1427, shows the treatment in a modified form, but Ghiberti's gates for the Baptistery at Florence are the first conspicuous instance of its employment. *See* Archaeology. Babylonian; Bambino illius. Bellerophon illius. Cleopatra illius. p. 2148; Door illius. p. 2782.

Religio Medici. Sir Thomas Browne's statement of his belief. It was written about 1635, and is quite short. It is divided into two parts, dealing with faith and charity. A devout member of the Church of England, Sir Thomas accepts the Christian belief in its entirety, finding in its mysteries and doctrinal difficulties only a further aid to faith. In this the Norwich doctor represents his age, but the tolerant and large-hearted way in which he speaks of other creeds shows him far in advance of it. The prose style is magnificent, if heavy with Latinisms. The work was popular abroad, being translated into several foreign languages.

RELIGION AND ITS SYSTEMS

Rev. J. W. Oman, D.D., Former Principal Westminster College, Cambridge, and E. G. Harmer

This article concludes with a section on the extent to which the various religions prevail throughout the world, a subject illustrated by a colour map. See the articles on the great religions; Buddhism; Christianity; Confucianism; Mahomedanism; those on their various branches, e.g. Roman Catholic Church; and the Lives of their founders. See also the entries on religious terms, e.g. Priest, and on religious movements, e.g. Reformation

The probable origin of the word is the Latin *religare*, to bind, and the most general mark of religion is this obligation of the sacred. Religion has been defined as "that which deals with the relation of God and man." But a really comprehensive definition of the term is a matter of difficulty.

In the 18th century, when religion was regarded as chiefly supernatural information about the deity and miraculous interference in events, it was not impossible to define and easy to describe. Then the study of it was confined to the task of weighing by argument the evidence for past events, with the clear issue that, though all religions might be false, only one could be true. But, at the close of the century, the Romantic Movement, with its sense of variety in human nature and of action and progress in history, discovered in religion a fundamental element of mind which enters into every aspect of life, is a prime moving force in all history, and the truth of which can be measured only by the whole range of spiritual values. Large investigations then opened out in three distinct directions. The first is occupied with the actual forms and faiths in which religion has manifested itself, the second with its special place in the human mind, and the third with the nature of the external reality on which it depends. Thus we have the history, the psychology, and the metaphysic of religion.

Idea of the Sacred

But if we cannot begin with definition or achieve adequate description, we have the greater need of some distinctive mark to separate what belongs to the subject from what is only accidentally connected with it. A sufficient mark is the idea of the sacred. Yet this must not be conceived either too narrowly or too widely. Much has been truly and even effectively religious which stirs no feeling merely of awe in our minds, while magic, though regarded with awe, and many myths, were rather primitive science and primitive poetry than primitive religion.

When religion is thus conceived, the study of it is much more than the investigation of evidence for

the supernatural, and we can no longer make a clean cut between true and false religions. But this does not mean that the question of truth is set aside. The sacred is concerned with an absolute claim not to be reduced to the convenient or the prudent, but valid only if the values it affirms have objective reality, both as the true nature of man and the ultimate meaning of the world. That reality, therefore, alone can be the final interest in any part of the study; and an unbiased pursuit cannot mean, as is at times assumed, an absence of personal interest in the result, but should mean, as in other studies, that no interest we can have could be forwarded except by the truth.

Experience and Interpretation

If religion has to do with feelings, and trusts, and aspirations, and not merely with the rites and creeds which give them expression, it requires, more than most subjects, our own experience for its interpretation. Indifference to truth is not the necessary equipment for discussing religion without bias. We may not start with our own particular form of Christianity as the externally given perfect form of religion, and pick out what agrees with it and dismiss the rest. Yet it is only as we have a higher religious experience that we can hope to understand the lower.

The history of religion now covers an immense area of investigation. On the subject of primitive religion alone there is an extensive literature, and the sacred books and critical histories of any one great religion present a formidable amount of material.

Fuller investigation has made ever more doubtful the assertion that races are to be found wholly without religion. Without some sense of the sacred, making a higher demand than convenience, and giving a securer trust than the working of blind forces, man would scarce have arrived at the stage of being human. But, even if some tribe were discovered too low in the scale to be religious, it is certain that at a very early stage of culture religion appears as inevitably as curiosity about the world around or the attempt to organize society; and, if it thus manifests itself as soon as oppor-

tunity offers, no more is necessary to prove that religion belongs to essential human nature.

The study of primitive religion seeks, as it were, to isolate the original germ. With regard to what can be achieved two mistaken ideas may be entertained. The first is that we may thus discover the origin of religion. Even the rites and ceremonies in which religion first expressed itself are beyond our knowing; and we have no means of discovering the thoughts and feelings they expressed, which are the real religion. But, even if we could, we still have not reached the origin of religion, which is, not how the idea of the sacred first came into use, but how it arose. That is a problem of mind, and not of history. The other is that the study may dispose of all religion as superstitions of the childhood of the race. If life's higher values were evolved out of it, we cannot dispose of even the lowest religion as superstition.

Evolution is not a device for getting higher values out of lower without anything being added, but at best some help towards showing how it was added, which still leaves what is added precisely the new, and therefore, the inexplicable. Wherefore, religion, like all else that has entered into human life, must be estimated by what it is, and not by how it came to be. Even when the results offered are less ambitious, they must be received with caution. They are reached mainly through ancient writings, agricultural myths and customs, and the religion of savages. But a community which writes and tills the soil is not primitive, and the childishness of the savage is no sure guide for knowing the progressive childhood of the civilized. Yet, in spite of these difficulties, it now seems reasonably certain that the attitude towards the world which religion requires was first related to a sense of a power in things resembling man's own life; that the awe of the sacred world was early stirred by the great forces of nature; that religion was from the first social in its expression and the sanction of social bonds; and that it was the mother of arts, the instigator of inquiry, the spring of moral obligation, and possibly the source of reason itself.

Progress of Religion

The second branch of this historical study deals with the progress of religion. It may concern itself generally with a broad survey of the evolution of religious values, showing how the sense of the sacred detaches itself from the material things which first stirred

the sense of awe and is turned into reverence for truth and beauty and goodness, how redemption moves from deliverance from the physical ills which work bodily harm to victory over all the evil that is in the world by reconciliation to a purpose which is over them and beyond them, and how in that progress the spiritual faculties of the human race are liberated and exalted.

Methods of Classification

More recently the various religions have claimed attention, because all historical study of the subject confirms Schleiermacher's view that each religion is an organic whole, to be estimated not merely by weighing the proportion of its higher and lower elements. Yet, if we are to regard the religions as stages of progress, we must classify them, not merely geographically, but on a principle which will arrange them in some order of lower and higher.

The primary division put forward by Schleiermacher was between "religions without founders" and "religions with founders." This agreed with his view of religion as intuition of the universe, and of the religions as distinct intuitions; for a higher religion was impossible without some original religious genius to produce the intuition by which it was organized. This distinction between what we may call unprophetic and prophetic religions is of the utmost importance, as appears in the progress from the 8th to the 6th century B.C., due to such great prophetic persons as Zarathustra, the Hebrew prophets, Socrates, Buddha, Confucius, and Lao-tse. Nor may we ignore the influence of Moses on the national Hebrew religion; and there may be no religion which is not in some sense prophetic.

The division of religions into national and universal, or natural and ethical, is practically parallel but national and universal elements are not always distinct; and, unless we restrict ethics to our own moral standards, there is no religion but is in some sense ethical. To the division into religions of nature and religions of redemption there is the objection that every religion is concerned with redemption, if only from the ills that threaten the bodily life. But that fact affords us the true principle of division, which is the kind of redemption each religion offers, to which must be related the values in man worthy of being redeemed, and the purpose above the world by which they are to be realized, and, therefore, the idea of God on which the purpose depends.

On this principle the following classification is suggested: (1) Religions of the natural life and of an animistic force, vaguely many and indefinitely one, whereby man seeks outward security through a power as personal as his own dim sense of his own personality in the communistic stage at which he lives permits. (2) Religions of anthropomorphism and external morality, whereby, having become an individual possessing property, man seeks to secure his state by beings like himself, who lay down external rules for what is yet mainly an outward life. (3) Religions of ecstasy and asceticism and a cosmic morality, which either do not depend on gods, or whose gods are pantheistic and identified with the order of things, because, seeking to solve the problem of the world by escaping from it, they do not depend for help on any power that rules the world. Of this Buddhism is one type and Neo-platonism another. (4) Religions of monotheistic tendency and ethical dualism, which, having realized the organization of good and evil in the world, seek to secure a higher life by faith that the power of light must ultimately prevail over the powers of darkness. The typical example is Zoroastrianism, but the later Greek religion also belonged to it. (5) Religions of true monotheism and reconciliation, which secure the spiritual life by making it the one eternal purpose, and by faith in the one God who works through all things for it. To it belong especially prophetic Judaism and Christianity.

Psychology of Religion

The second study, the psychology of religion, deals with the origin and working of religion in the mind. From the time of the ancient Greeks, religion has been explained away as fear, or vanity, or the fashioning of the world according to our desires. Modern psychology has to acknowledge it an original and fundamental element of human nature, but many studies, especially from France and America, deal with matters like a pre-logical stage of mind, conversion, mysticism, social and mass religious ideas, still with the purpose of explaining religion on purely mental grounds without any external reality to which it corresponds.

Thus Durkheim ascribes to it all social progress and even the development of reason, but, though the sacred is thus eminently useful, it is apparently a mere social device without sanction from the nature of things; and Leuba regards it as an aspect of the will to live, encouraging us in our task of

managing the world by the imagination of beings like ourselves ruling behind its blind forces. Without the sense of sacred obligation above convenience, reason and social order and a victorious freedom in life could hardly have been achieved. But, if illusion works better than reality, we have not even a pragmatic basis for truth. A more serious psychology has sought to find the essence of religion in some aspect of mind—Kant in will, as the assurance of the moral order; Hegel in intellect, as popular philosophy; Schleiermacher in feeling, as artistic intuition of the whole in all things.

Later Interpretations

Kant is nearest the reality, but, as the values of religion also concern truth and beauty, later writers, like Dr. Inge, seek it in a harmony of all our powers. But no religious person is concerned to maintain this balance of self-culture. His interest in what is sacred is purely as he believes it to be concerned with an absolute and eternal worth in man, which corresponds with the ultimate meaning of the world. The psychology of religion is only an extension of the ordinary psychology of mind. It is an empirical science, dealing with observed facts of mind, without going on to speculate about the nature of reality. But it does not deal with mind as if mind were all.

The metaphysics of religion has to do with the higher world of spirit and our way of knowing it, being also simply an extension of the ordinary metaphysics of experience. This does not mean that all theology is philosophical abstraction, or that faith must be determined by philosophical demonstration, or that the spiritual values which have required great prophetic souls and the long process of history can be produced by philosophical argument from the individual mind. On the contrary, it is the business of this study to justify for religion its own way of knowing its realities. Especially it must show how the question of God means the reality of the absolute claim of all that is of final worth in man and all that he holds sacred in life.

J. W. OMAN

GREAT RELIGIONS OF THE WORLD. The word *heathen*, as used on the map, comprises those primitive peoples whose attitude to the supernatural may be comprehended under the general term *magico-religious*. It is to be preferred to *animist* because animism does not cover all forms of primitive belief. Some of them were pre-animistic, some tend to pass into

1. Strozzi Palace, Florence, 1489-1536. 2. Fava Palace, Bologna, 15th century. 3. Scuola di S. Marco, Venice, rebuilt 1485-95. 4. Dome of S. Peter's, Rome, designed by Michelangelo and completed in 1606. 5. Old

Library, Piazzetta, Venice, 1536-53. 6. Entrance to the Pavillon Sully, Louvre, Paris, early 17th century. 7. West front and main entrance of S. Paul's Cathedral, London, 1710. 8. Façade of Cloth Hall, Brunswick, 1591

RENAISSANCE : EXAMPLES OF THE STYLE OF ARCHITECTURE WHICH SUCCEEDED THE GOTHIC

polydaemonism, if not into polytheism. All may be regarded as representing steps by which the religious idea advanced from the contemplation of nature to the recognition of the supreme power behind. They include such specialised aspects as the fetishism of W. Africa, the nature-worship of aboriginal America and Australia, and the shamanism of N. Asia. They possess two characteristics in common; they are non-ethical, and are not founded on a law or scripture.

Outside the pale of heathendom thus defined lie the world's great ethical religions. The oldest of them is Judaism, the national monotheism of the Jewish people, remarkable for the fact that, cradled in W. Asia, it is now disseminated by racial dispersion over almost the whole earth.

Side by side with this outcome of the Semitic spirit arose in a later age, out of the personalised polytheism of Vedic India, the great system of Brahmanism, which still penetrates the religious and social life of Hindustan. Nowadays this term, properly denoting the ancient Brahma-worship, offered through the priestly offices of the Brahman caste, loosely embraces also many later and diverse sects which are preferably classed as Hinduism. This comprises such developments as Saktism, Lingayatism, and Sikhism, as well as the widespread popular religions which, especially among the aboriginal villagers of S. India, are suffused with animistic practices and with survivals of primitive nature-worships.

In the 6th century B.C. arose the reform founded by Gautama Buddha. Dominant in India for many centuries, it has long been submerged in its homeland by modern Hinduism. The first great missionary faith, it prevails today in Ceylon, Burma, Siam, China, and Korea. In the form of Lamaism, which has absorbed both animist and Hindu elements, it is found in Tibet and Mongolia. In Japan it has profoundly affected Shintoism, a nationalistic cult that was originally a local development of animism.

While the Buddha was spreading his teaching in N. India, Confucius was preaching an ethical philosophy of an altruistic cast in China, and his contemporary Lao-tse was promulgating those views which were ultimately to develop into Taoism. China's state religion recognizes the supremacy of Confucius, but in the popular mind religion and its ritual of ancestor-worship have been much affected by the influence of Buddhism, while modern Taoism is a polytheism with much primitive animism. Christianity, the supreme faith of mankind, stands alone both in the ethical and in the spiritual sphere, in the number of its adherents, and in the universality of its appeal.

The latest of the great religions is Islam. Founded in the 7th century A.D. by Mahomet, it embodies Jewish and Christian elements, but from the outset manifested marked hostility to both. From its Arabian cradleland it spread over N. Africa in one direction, into Persia, India, and central Asia in another, besides following the path of Arab migration into Malaysia and modern negro Africa.

E. G. Harmer

The following table gives approximately the numbers of adherents of the chief religions:

RELIGIONS OF THE WORLD: APPROXIMATE FIGURES

CHRISTIANS :		
Roman Catholics ..	331,500,000	
Orthodox Catholics ..	144,000,000	
Protestant ..	206,900,000	
Coptic Christians ..	10,000,000	
		692,400,000
NON-CHRISTIANS :		
Jews ..	15,900,000	
Muslims ..	210,000,000	
Buddhists ..	150,180,000	
Hindus ..	230,150,000	
Confucians and		
Taoists ..	350,600,000	
Shintoists ..	25,000,000	
Animists, etc. ..	135,650,000	
Unclassified ..	50,870,000	
		1,168,350,000
		1,860,750,000

Religious Tract Society. British society founded in 1799 and now part of the United Society for Christian Literature (*q.v.*).

Remagen. Town of W. Germany, in Rhineland-Palatinate. On the site of the Roman Rigmagus, it is on the left bank of the Rhine, 23 m. N.W. of Coblenz. The rly. junction for Wiesbaden, it has a small distilling industry. Here during the Second Great War the Allies made their first crossing of the Rhine, the U.S. 9th armoured div. coming unexpectedly at Remagen, March 8, 1945, on the only bridge across the Rhine intact, the Ludendorff rly. bridge. A lieutenant, on his own initiative, rushed the bridge, surprising and overrunning a German demolition party. No major operation was effected from the bridgehead so gained, but the potential threat forced a dispersal of German reserves. The bridge collapsed March 17, but by then several temporary bridges had been built. Remagen came within the French zone of occupation. Pop. 7,000.

Remainder. Term used in English real property law. The law about remainders is very technical. When a particular estate of freehold is granted to a person, with remainder to another, it means that the latter is to take the property when the particular estate determines. An illustration will make this more clear. X is the owner of Blackacre. He grants or devises it to A for life (particular estate) with remainder to B in fee. B takes on A's death; and even if B dies before A, B's heirs take.

A contingent remainder is one limited to take effect on the happening of an event or the fulfilment of a condition which may or may not happen until after the determination of the particular estate. As when X leaves his property to his widow for her life, and after her death to his son John if he shall then have attained (or on his attaining) 21 years of age in fee. Since 1925 remainders cannot exist as legal estates; but future interests having all the characteristics of remainders may be created as equitable interests.

Remand (Lat. *remandare*, to order back). In law, the adjournment by a criminal court of the hearing of a charge against an accused person. The prisoner may be either retained in custody or

admitted to bail. A remand in custody, if by verbal order, must not be for more than three days; if on a written warrant, it should not exceed eight clear days. Children under 17 are remanded, not to prison, but to remand homes specially provided. See Trial.

Remand Home. Institution in the U.K. to which children and young people waiting on remand for a decision of the court can be sent. Until the passing of the Children's Act, 1908, children and young persons on remand or awaiting trial by the courts were sent to prison. The 1908 Act provided for special places of detention for young persons. These, however, were the responsibility of the police authorities and tended to be punitive in atmosphere. The Children and Young Persons Act, 1933, made it the duty of every county and county borough to provide remand home accommodation, either alone or jointly with a neighbouring authority. It also empowered local authorities to use homes run by voluntary bodies provided they were inspected by the Home office and run according to Home office rules. Responsibility for running remand homes is vested in the local education authority. In 1950 there were 51 remand homes for boys, 31 for girls, and 3 mixed homes.

Remand homes were intended primarily to shelter children committed to them by the courts on remand. Many children are committed to them for the purpose of obtaining medical and psychological reports to assist the juvenile court in reaching a decision as to the child's future.

Remand homes may also be used (a) as "places of safety": under section 67 of the 1933 Act, a child in need of care and protection may be sent to a remand home temporarily; the Curtis committee, 1945, recommended that this should be for not more than 14 days; (b) for children committed to the care of the local authority and awaiting boarding-out; (c) for the detention of boys and girls awaiting admission to approved schools; (d) as places of "punitive detention": section 54 of the 1933 Act empowers a court to order the detention of an unruly child in a remand home for a period not exceeding one month; (e) as places of detention for absconders from approved schools.

Remand homes are used for children over 8 (the youngest age at which they are considered in law to be criminally responsible),

and for young persons up to 17. Occasionally younger children in need of care and protection are admitted temporarily. Remand homes must be equipped so that the period children spend in them can be used constructively, but their population is so mixed and rapidly changing that it is difficult to provide satisfactory educational and recreational facilities.

Remarque, ERICH MARIA (b. 1898). German-born American novelist. Born at Osnabrück, his real name being Kramer, he left school young and went into the army, fighting in the First Great War. His first novel, *All Quiet on the Western Front*, 1929, a bitter and disillusioned picture of modern war, created a sensation and was translated into many languages. Later books, *The Road Back*, 1931; *Three Comrades*, 1937; *Flotsam*, 1941; *The Arch of Triumph*, 1946, were not so successful, but continued his picture of a world of violence and irrationality. He lived in Switzerland from 1929 to 1940, and then went to the U.S.A., becoming an American citizen. He had already, in 1938, been deprived of his German citizenship by the Nazis.

Rembang. Seaport of Java, Indonesia. It is on the N. coast, 50 m. E.N.E. of Samarang by rly. Sugar cane, teak, and petroleum are obtained from the surrounding district, which formerly constituted a Dutch residency. Rembang was heavily raided from the air on Feb. 5, 1942, and fell to the Japanese on March 3. It was liberated when Australian troops landed in Java in July, 1945.

Rembrandt (1606-69). Dutch painter, whose full name was Rembrandt Harmensz van Ryn (or Rijn). Son of a miller, Rembrandt was born at Leyden, July 15, 1606, and was apprenticed to a local painter named van Swanenborch. He studied at Amsterdam under Pieter Lastman, but his preference for independent observation and methods of work brought him back to Leyden in 1624. Several paintings and many etchings showed that he strengthened his command of drawing and the use of oils between that date and 1631, when, with a growing reputation, he settled in Amsterdam. His fame was firmly established by the *Anatomy Lesson*, now at The Hague, which he painted on commission in 1632. In 1634 he married Saskia van Vlyenborch (d. 1642), a Frisian, whom he portrayed in various paintings and drawings.

Commissions and pupils increased in numbers, and among the productions of prosperous years were *The Bride of Tobias* (Hermitage, Leningrad), 1636; *The Angel leaving Tobias* (Louvre), 1637; *The Marriage of Samson* (Dresden), 1638; and the self-portrait now in the National Gallery, London, 1640. In 1640 came *The Canal*, first of Rembrandt's landscape etchings from nature; *The Windmill* etching following in 1641.

After the completion in 1642 of the great painting generally called *The Night Watch* (Amsterdam), a corporation painting for the Amsterdam Civic Guard, Rembrandt's fortunes seemed to be crossed. His expensive style of living and

Rembrandt
Self-portrait

natural generosity diminished his quickly made fortune, and rapidly mounting debts led to his being declared bankrupt in 1656, when his valuable private collection of works of art was sold up for the small sum of 5,000 florins. But his powers remained undiminished, and these last years of misfortune saw some of his finest works, among them *The Adoration of the Magi* (Buckingham Palace), 1657; a fine self-portrait (Munich), 1658; and the well-known *Syndics of the Guild of Drapers* (Amsterdam), 1661. In 1662 died Hendrikje Stoffels, his mistress faithful in misfortune, whom he probably married after 1656. The master himself died in poverty at Amsterdam, and was buried in the Westerkerk, Oct. 8, 1669.

Rembrandt's development as a painter shows three main periods. In his first manner, influenced by his masters, he is tentative, dwelling with care upon detail, but early

showing individuality by his use of a full light upon his centre of interest. The Philosopher, about 1630 (National Gallery), shows well the qualities that were later to develop. After a few years in Amsterdam, his second period, about 1635-42, shows a freer expression of personality. Detail is abandoned for bold, solid strokes of the brush; conception and treatment of subjects are broader; the characteristic tones of gold and brown are freely used; and great dramatic force is given by his contrasted effects of light and shadow.

In his third phase, 1642-69, we find Rembrandt making even fuller use of his discovery of the power of chiaroscuro, delighting in massive effects of dark shadow built up of rich sombre colours, and bringing into his schemes a peculiar deep glowing red. These "Rembrandt-*esque*" qualities have profoundly influenced the character of painting. He must be ranked among the greatest artists who ever lived, and in the portrayal of old men has scarcely an equal.

In the history of etching Rembrandt stands pre-eminent also. Controversy has been keen as to the genuineness of all the plates ascribed to him, but he can safely be credited with about 290, and, like his paintings, these have had great artistic influence. Broadly his etching developed along lines parallel with his painting. After about 1640 he passed from detail to use of the dry-point to stress his light and shadow effects, well seen in *The Three Trees*, 1643, and after 1650 shows a wonderful mastery over the whole tone of his plates, memorable among which are *Christ with the Sick around Him* (the "Hundred Guilders Print"); *Christ Appearing to the Disciples*, 1650; *Christ between His Parents*, 1654. See *Abraham illus.*; *Dutch School of Painting*; *Etching*. *Jesus illus.*; *Painting*.

Bibliography Rembrandt, H. Knackfuss, Eng. trans. 1899; *Etchings of R. P. G. Hamerton*, 1905; Rembrandt, J. B. Manson, 1923; R. and His School, J. C. Van Dyke, 1923; Rembrandt, A. M. Hind, 1938; Rembrandt, H. W. van Loon, 1943; *Selected Paintings of R.*, Phaidon Press, 1943.

Remembrance Day. Day which in Great Britain after the Second Great War replaced Armistice Day (*q.v.*) as the occasion for remembering those who lost their lives in the two Great Wars. It was fixed as the Sunday preceding Nov. 11, or on Nov. 11 or 12 if either of those days happened to fall on a Sunday

Remembrancer. Title formerly held by certain clerks of the English exchequer. The king's remembrancer, with whose office that of lord treasurer's remembrancer was amalgamated in 1833, was an officer who "reminded" the judge and kept certain records. He is now head of a department of the central office of the supreme court. In London the city remembrancer is an officer who watches the legislative interests of the corporation.

Remington, PHILIP (1816-89). American manufacturer and inventor. Born at Litchfield, N.Y., he became one of the controlling heads of his father's small-arms factory. He was the inventor of the breech-loading rifle which bears his name, and in 1873 was one of the first to construct a practical typewriter. The Remington rifle was adopted by several European governments, and supplied to the Federal government during the Civil War.

Remiremont. Town of France. It stands on the left bank of the Moselle in the dept. of Vosges, 13 m. S.E. of Epinal. The manufactures include cotton, hosiery, and boots and shoes. The chief building is the abbey church, mainly of the 14th century. The palace of the abbess was made into the municipal headquarters, and was rebuilt on the original plan in the 19th century, but some houses of the canonesses remain.

The town was founded about 800, and about 1100 the nuns from an abbey, founded on a hill near by S. Romaric, removed here, and their house soon became wealthy and famous. The abbess, who was strong enough in the 16th century to carry on a war with the duke of Lorraine, was a princess of the empire, and the 50 canonesses were all of noble birth. The house was suppressed at the Revolution.

In the Second Great War severe fighting occurred in the neighbourhood during mid-Sept.-mid-Nov., 1944, the Germans offering fierce resistance in the Vosges hills to the advancing French and U.S. forces. Long part of Lorraine, it was joined to France in 1786. Pop. 10,319.

Remonstrants. Calvinist sect of the Netherlands led by Arminius (*q.v.*) and deriving its name from a remonstrance addressed 1610 to the states of Holland denying any intention of stirring up disputes in the church. Favoured by Barneveldt, they were opposed by Prince Maurice who had them proscribed. 1617. but

were treated with more toleration after Maurice's death, 1625.

Remote Control. Method of controlling a mechanism from a distance by electrically operated devices. One such device is breaking the beam from a photo-electric cell and so giving the initial impulse to mechanism which opens doors or stops machinery in an emergency. Radio waves help to land aircraft in fog, while the automatic pilot keeps aircraft on a fixed course. Electromagnetic gear is used for the remote control of electric motors from a central point. Automatic telephones and lifts, and the automatic signalling and shunting equipment on railways, involve this principle. Many street lighting systems are fitted with photo-electric remote control gear which turns on or switches off the lamps according to the degree of natural light. See *Automatic Pilot*; *Photo-electric Cell*; *Radio Control*; *Relay*.

Remscheid. City of W. Germany in N. Rhine-Westphalia, 20 m. N.N.E. of Cologne. A big industrial centre, it lies amidst wooded hills, at 1,200 ft. alt., on a main rly. It possessed fine old houses of the baroque and rococo period, and there have been forges and tool-making shops since the 11th century; others were set up by Huguenot and Dutch emigrants in the 17th century. The centre of German tool making, Remscheid also produced skates, household machinery, and steel goods. It had the oldest German dam, the Eschbach-Talsperre (1891); the highest bridge, at the suburb of Müngsten, 350 ft. high and 1,660 ft. long; a museum and monument devoted to Röntgen, discoverer of X-rays, who was born near; and a town hall in Renaissance style, built 1906-09. In the former Rhine prov., it lay within the Ruhr pocket of resistance in April, 1945. After the end of the war it came within the British zone of occupation. Pop. (1950) 96,000.

Remsen, IRA (1846-1927). American chemist. Born Feb. 10, 1846, in N.Y.C., he was educated there and at German universities, where he went on to do research in pure chemistry. He taught that subject at Williams College, 1872-76, and from 1876 was at Johns Hopkins university, being professor of chemistry and director of laboratories, secretary of council, and during 1901-13 president. Founder in 1879 of the American Chemical Journal, he described therein a compound he had (with

Fahlberg) discovered, soon widely known as saccharin. His textbooks were standard works and widely translated. He died March 5, 1927.

Remus. Twin brother of Romulus, the legendary founder of Rome. See Romulus.

Rémusat, CHARLES FRANÇOIS MARIE, COMTE DE (1797-1875). French philosopher and statesman. Born in Paris, March 14, 1797, the son of Auguste Laurent, comte de Rémusat (1762-1823), one of Napoleon's chamberlains, he studied law, and soon published political and critical articles. Influenced by Guizot, he became a deputy, 1830, and was minister of the interior

under Thiers, 1840. His works include *Essais de Philosophie*, 1842; *Sur la Philosophie Allemande*, 1845; *Abélard*, 1845; *S. Anselme*, 1852; *L'Histoire de la Philosophie Anglaise depuis Bacon à Locke*, 1875. Admitted to the Académie Française, 1846, he was exiled by Napoleon III, 1851-59, but held the foreign office again during the premiership of Favre 1871-73. He died in Paris, June 6, 1875.

Comte de Rémusat.
French philosopher

artistic and literary centre. There the two greatest of the Medici, Cosimo (1389-1464) and his grandson Lorenzo the Magnificent (1448-1492) used the wealth acquired by shrewd international banking to subsidise and encourage scholars, painters, sculptors, and architects, Lorenzo, in particular, gathering round him a band whose learned discussions emulated those of Plato's Academy. The revival of the spirit of ancient Athens which permeated 15th cent. Florence is perhaps best illustrated by the great competition for the design of the gilded doors of the Baptistery, commissioned by the city in 1400 after the departure of the plague. The greatest talent in Italy flocked to compete, and when Donatello, Brunelleschi, and the others saw Ghiberti's model designs they unanimously praised the judges to give him the prize.

Florence's Contribution

In this spirit and against a background of ceaseless political experiment Florence produced an art which can be set against that of any other period in modern history. Cimabue (1240-1300) first led the breakaway in painting from the stiff Byzantine tradition; his pupil Giotto (1276-1336) carried it on as painter, sculptor, and architect, leaving the cathedral tower of Florence as, perhaps, his greatest masterpiece; and from then onwards there was a continuous succession of great names, and an unbroken line from Machiavelli of great historians to chronicle their achievements, until the movement reached its climax in Raphael, Michelangelo, and Leonardo da Vinci, who were all producing their greatest work at the beginning of the 16th cent. Every city in Italy could boast a history similar to, though less distinguished than, that of Florence.

Under the papacy of the Medici Leo X (1513-1521) supremacy passed again to Rome, where Raphael and Michelangelo did much of their greatest work. But the sack of Rome in 1527 and the capture of Florence by Charles V in 1530 put an end to the period of great art, except in Venice, where a splendid tradition in all the arts reached its climax only in the 16th cent. with Titian (1477-1576) and Tintoretto (1512-1594).

The Italian Renaissance sprang in essence from a new approach to the natural world and so ultimately involved every kind of human activity. To Leonardo da Vinci the arts which he practised were only part of a ceaseless study

THE RENAISSANCE

W. L. McElwee, author of *The Reign of Charles V*

In connexion with this article, see the biographies of the scholars of the Renaissance, e.g. Colet; Dante; Erasmus; More; Petrarch; and those of the painters of the period. See also Architecture; Art; Humanism; the histories of the various countries, England; France Italy; etc., and the article Reformation

The Renaissance (Fr. *re*, again; *naître*, to be born) was the whole process whereby Europe passed from a medieval to a modern civilization: "the fructifying of the human mind through contact with the classical world of Greece and Rome." Obviously such a change cannot be accurately dated. Historians have traced its first beginnings to the time of Charlemagne and its further progress through the so-called Ottonian Renaissance of the 10th cent. and the 12th cent Renaissance, while medieval habits of mind survived here and there well into the 17th cent. It was the "revival of learning," and especially of the study of Greek, which first weakened the rigid conventions of the Middle Ages; and in consequence the fall of Constantinople in 1453 and the invention of printing in 1440 have each been chosen as the decisive event marking the transition. But Manuel Chrysoloras was teaching Greek in Florence in 1396, and three famous scholars taught Greek in Padua alone between 1420 and 1430. In fact there were plenty of itinerant teachers of Greek in Italy before the influx of refugees from Constantinople, and the collection, translation, and copying of ancient manuscripts had already spread the knowledge of Greek and Latin literature throughout Europe and built up great libraries like those of Pope Nicholas V and Cosimo de' Medici before printing made the spread of knowledge so much easier and swifter

The revival in a secular and humanistic spirit of the study of ancient authors at first became in Italy an attempt to recreate the glories of ancient Rome. Dante looked forward to a revived Holy Roman Empire and Petrarch (1306-1374) wrote his Letters in a style intended to rival that of Cicero; while scholars like Poggio Bracciolini (1380-1459) grubbed in monastery cellars and libraries for the lost masterpieces of antiquity. Thus, though the tales of Boccaccio (1313-1375) pointed the way to a new, light, essentially secular and vernacular literature for a century or so the full development of the movement was hindered by pedantry and antiquarianism. Rome naturally became the first centre of the revival, especially when Pope Nicholas V boldly decided to harness in the church's service the new forces which indirectly threatened many of the traditions on which papal supremacy rested. He became one of the first great Renaissance patrons, paying, for example, 500 ducats for a translation of Thucydides by Lorenzo Valla, who had narrowly escaped the Inquisition when he exposed the forgery of the Donation of Constantine: and he succeeded in diverting some of the impetus of the new learning into the study of early Christian Greek writings and the rediscovery of Christian as well as of pagan antiquity

Throughout the 15th cent. however, Florence rivalled and for a time outshone even Rome as an

of all natural phenomena. He worked as a military and civil engineer, an irrigation expert and a town planner, he designed engines of war and projected a flying machine. Such an attitude of mind left no definable frontier between art and science, and led inevitably to a revival and complete reform of scientific study. Titian was employed to illustrate Vesalius's textbook of anatomy. The study of ancient geographers led to the discoveries of Vasco da Gama and the Portuguese, Columbus and the Spanish conquistadores; and most of the Renaissance energy of Spain and Portugal was diverted into the exploitation of these. Thus the experiments and achievements in astronomy, mathematics, and physics of Copernicus, Galileo, and Newton, and the medical discoveries of Harvey must be regarded as the culmination of the revival of learning. Another inevitable consequence was a wholly new outlook on education, evolved by men like Vittoriano da Feltré, who conducted a celebrated academy for the sons of the nobility at Mantua, and most lastingly embodied in the English public schools.

Renaissance Politics

In politics and religion the results of the new movement were as far-reaching, but less easy to trace and define. Purely political forces were already at work to destroy the medieval conception of a united Christendom before the humanistic preoccupation with individual rights and capacities came to strengthen national prides and antipathies which divided Europe into self-conscious nation states and substituted the realistic outlook associated with Machiavelli's Prince for the idealism of the Middle Ages. Similarly, the Reformation cannot be described as a direct consequence of the Renaissance, though the new spirit of limitless inquiry and criticism and the passion for scientific accuracy undoubtedly fostered a habit of mind which facilitated the attack on the church's established institutions and hampered the papacy's defence.

The movement thus started in Italy found its clearest echo in France. Racially more akin to the Italians than other nations and more directly linked than most to the civilization of ancient Rome, the French set themselves to imitate the Italian achievement—a tendency enormously stimulated by the Italian wars of Charles VIII

Louis XII, and Francis I between 1494 and 1546. The poets of the Pléiade, of whom Ronsard (1524–1585) was the one great creative genius, deliberately set themselves to remould and perfect the French language on the basis of a close study of the classics. The real Renaissance spirit—the adventurousness and the great appetite for life—were to be found at their best in Rabelais (1500–1553). But he was not typical of the French Renaissance, which became rather an elegant adaptation of the achievements of the Italian city states to the taste of the monarchical and aristocratic society of France. Thus the court painters, such as Clouet, and the architects, decorators, and landscape gardeners of the great châteaux were the more characteristic products of the new movement, though in the world of scholarship men like Budé and the younger Scaliger followed in the authentic tradition of the Italian humanists.

German Humanism

There were already discernible beginnings of the humanistic outlook in Germany when Rölöt Huysmann, surnamed Agricola, first carried "out of Italy a breath of the higher culture," and the German Renaissance quickly diverged again from the Italian tradition. A greater preoccupation with the more serious side of life, with religion rather than with pagan antiquity, with matter rather than with form, with content rather than style, marked the work of the great 16th cent. German scholars like Reuchlin and Melancthon, and the wandering Flemish scholar, Erasmus, who was closely linked with them and greatly influenced the early development of Luther. Though their classical scholarship was sound the German tradition had always tended to be anti-Roman and, since the Roman remains in Germany were much slighter than those which stimulated the Italians to imitate antiquity, the Germans were more concerned with the current abuses in church and papacy than with the glories of the Roman empire. In the Augsburg created by the banking wealth of the Fugger (*q.v.*) family, and in the great industrial and commercial cities of the Netherlands, leisure and wealth in the latter half of the 15th cent. produced an artistic revival almost rivalling that of Florence. From the first, however, the classical influence of the new learning on the N. European Renaissance was subdued by the

pietism emanating from the Netherlands. In consequence the movement was early and easily diverted into an anti-papal crusade when Luther launched the Reformation, and German humanism, along with the artistic revival which produced Dürer and Cranach, was swamped in religious controversy.

Influences in England

In England, too, there was the tendency to adapt the learning that came from Italy to a native tradition and to preserve far more than the Italians of the medieval outlook. Linacre and Grocyn taught at Oxford what they had learnt in the universities of N. Italy, but their pupils, More and Colet, remained essentially conservative and orthodox. Like Erasmus, who was their great friend, they combined real scholarship and minds highly critical of current abuses in church and state with loyalty to established forms and institutions. The influence of such men on the English Reformation was only indirect, and it was through their educational reforms and their new schools that they made their most substantial contribution to the real English Renaissance, which achieved its greatest triumphs in Elizabethan literature, in the poetry of Spenser and the plays of Shakespeare, and in the music of Purcell and Orlando Gibbons.

Politically as well as culturally the history of Western Europe—and derivatively of much of the rest of the world—has since been concerned in the working out of the ideas, discoveries, and habits of thought to which the Renaissance gave the first impulse and, though there are signs now that the emphasis on the individual, his capacities, and his rights, which was the essence of humanism, is giving way to new conceptions of society and of man's place in it, it may be that the impetus of the Renaissance is not yet wholly exhausted.

Renaix (Flemish *Ronse*). Town of Belgium, in the prov. of E. Flanders. It lies in hilly country, 26 m. by rly. S. of Ghent, and is a rly. junction of importance. There are industries in cottons, woollens, bootmaking, brewing, and trade in local agricultural produce. The town is pleasantly situated and is a summer resort. The 11th century church of S. Hermès, built in the Romanesque style, has a fine crypt. Pop. 25,433.

Renan, JOSEPH ERNEST (1823-92). French philosopher and philologist. Born at Tréguier, Brittany,

J. Renan

After Bonnat

Feb. 27, 1823, and educated for the priesthood, he left the seminary of S. Sulpice in 1845, diverted from the theology by the scholastic methods of the time, and devoted himself, with the assistance of his sister Henriette, to the study of letters, and especially to the study of Oriental languages. For a time he was assistant master in a boys' school. In 1850 he secured an appointment at the Bibliothèque Nationale, Paris, and visited Italy. In 1852 came his work on Arabian philosophy, *Averroès et l'Averroïsme*, followed by his *Histoire Générale des Langues Sémitiques*, 1854, *Études d'Histoire Religieuse*, 1856, and *Essais de Morale et de Critique*, 1859.

One of a commission sent by the French government in 1860 to Phoenicia and Palestine, his appointment, 1861, to the professorship of Hebrew at the Collège de France, owing to clerical opposition, was not ratified until 1870. In the meantime he lost by death his sister, Henriette, whose devotion he commemorated in *Ma Soeur Henriette*, 1895 (Eng. trans. Brother and Sister, 1896), and published his best-known work, *Vie de Jésus*, 1863. Most of this work, which formed the initial volume of his *Histoire des Origines du Christianisme*, was written during his visit to Syria. The other volumes of the series deal with Christianity down to the time of Marcus Aurelius.

Renan's other works are *L'Histoire du Peuple d'Israel*, 1888-94; *Dialogues Philosophiques*, 1876; *Drames Philosophiques*, 1888; and *L'Avenir de la Science*, a work of 1878 first issued in 1890. In 1878 he was elected to the Academy; in 1880 he delivered in London the Hibbert lectures on *The Influence of Rome on Christianity*. He married in 1856 a daughter of Ary Scheffer, who died in 1894. Given the cross of the Legion of Honour in 1880, he was made a grand officier in 1888. He died Oct. 2, 1892, and was buried at Montmartre. A statue to his memory, by Boucher, was erected by the French government at Tréguier, in 1903, much against the wishes of the R.C.s of the town.

An emotional romantic, who repudiated the charge of atheism, whose Life of Jesus pained the orthodox believer, and whose *L'Abbesse de Jouarre* was described as an attempt to raise sensuality to the rank of religion, Renan was the greatest French prose writer of his time, and a scholar whose sympathies were as universal as his knowledge was extraordinarily wide, if somewhat lacking in depth. As a philosopher he took up an attitude of somewhat superior, even ironical, detachment, slurred over rather than faced difficulties, and, especially in his later years, was prone to a good-natured acceptance of things as they are. It was said of him that he thought like a man, felt like a woman, and acted like a child. His conversation had all the fascination of his style, which, while vivid and picturesque, is classic in clarity and simplicity.

Renault, LOUIS (1877-1944). French engineer. Born in Paris, Feb. 12, 1877, he served an apprenticeship in engineering and became one of the pioneers of motor car design. In 1898 he introduced the now universal practice of having a driving-shaft to couple the engine with the back axle of a motor vehicle. Two years later he founded the firm of Renault Brothers, one of the first large-scale builders of cars. In 1905 he introduced taxis in Paris, and in 1907 designed and built the first efficient air-cooled aero engine. Later he designed armoured fighting vehicles, and the 70-ton Renault tank

was the heaviest vehicle of this class in service with any army at the outbreak of the Second Great War. Renault died Oct. 25, 1944, while awaiting trial for collaboration with the Germans. The Renault plant was nationalised 1945.

Rendsburg. Town of Slesvig-Holstein, Germany. It is 18 m. W. of Kiel, on the Kiel Canal. Called Reinoldesburg in the 12th cent., it became a town in 1339. From 1539 to 1852 it was a strong fortress, and later developed into a rly. junction and an inland port. The Gothic church of S. Mary (1297) and the town hall (1566) are the main buildings. The town was one of the bases of Slesvig-Holstein forces in the war against Denmark, 1848-50. It was little damaged in the Second Great War, and after the surrender of Germany came within the British zone of occupation. Pop. (1950) 36,000

René (1409-80). Duke of Anjou, called the Good. Son of Louis II of Anjou, he was born at Angers, Jan. 16, 1409, and married in 1420 Isabella of Lorraine, whose uncle, disputing the inheritance, captured René at Bulgnéville, 1431. In 1434 René inherited Anjou and Provence, and proved a popular ruler, occupying himself with the arts and literature of his domains and fostering their agriculture, etc. He handed the succession of Aragon to his son John of Calabria (d. 1470), but Louis XI persuaded him, 1474, to bequeath his dominions to Charles of Maine, so that Anjou should revert to the French crown. He died July 10, 1480, leaving poems, romances, and other writings of considerable merit. His daughter Margaret married Henry VI of England, 1445.

Renegade (Span. *renegado*, cf. runagate). One who deserts his principles, more especially one who apostatises from his faith from other than conscientious motives. The word was first used of Christians who embraced Mahomedanism to avoid persecution.

Renfrew. Royal and municipal burgh and the county town of Renfrewshire, Scotland. It stands on

Renfrew arms

the left bank of the river Clyde, 5 m. by rly. W. of Glasgow, and has an airport. Claiming to be the oldest burgh in Scotland and formerly a considerable Clyde port, it lost much of its importance, but in the 20th century basins and docks which can accommodate the lar-

Renfrew. Town Hall of this Scottish county town

gest vessels were constructed. Castlehill marks the site of the castle of the Stewarts. Shipbuilding is the staple industry, and there are boilermaking and engineering works. Market day, Sat. Pop. est. 17,000.

Renfrew. Town of Ontario, Canada. Situated on the Bonnechere river, 8 m. from its confluence with the Ottawa, it is also on the main lines of the C.P.R. and C.N.R. Chief industries are the making of textiles and machinery. Pop. 5,673.

Renfrewshire. County of Scotland. In the S.W. of the country, it is bounded N. and W. by the Clyde, only a small portion lying N. of that river. Its area is 240 sq. m. The surface is generally undulating except in the S., where there are hills.

Renfrewshire arms

The chief rivers are the Carls, Black and White, tributaries of the Clyde, and Loch Thom is the most important of several lakes. The part that lies along the Clyde is an industrial area; here are Paisley, Greenock, Port Glasgow, Gourrock, and parts of Glasgow. Elsewhere agriculture is carried on. Renfrew is the county town. The co. sends two members to parliament. Renfrewshire was part of the county of Lanark until about 1400. A prince of Wales bears the title of Baron Renfrew. Pop. est. 322,700.

LITERARY ASSOCIATIONS. William Wallace, the great hero of Scottish history and legend, is supposed to have been born at Elderslie, near Paisley. The 16th-17th century Semphills, Sir James, his son Robert and grandson Francis, all

of Beltrees, won distinction as writers, Robert Semphill being credited with reviving the verse stave, of which Burns was later to make great use. Robert Pollok, author of *The Course of Time*, was born at Eaglesham. John Wilson (1720-89), author of a "loco-descriptive poem" on the Clyde, was for 20 years master of the Greenock grammar school. Another native of Paisley of the same name is better known by his pen-name of Christopher North. Robert Tannahill, the weaver poet, was born in Paisley, worked and died there, and a bronze statue to him stands in the Abbey burial ground. Alexander Smith, 1830-67, passed his childhood in Paisley, and wrote of his life there in his autobiographical story, *Alfred Hagart's Household*. At Greenock John Galt lived for many years and is buried. Gourrock was for some years the residence of the novelist Neil Munro. *Consult* Description of the Sheriffdoms of Lanark and Renfrew, W. Hamilton, repr. 1878.

Reni, GUIDO (1675-1642). Italian painter. Born at Calvenzano, Nov. 4, 1575, he studied

under Denis Calvaert, and with the Carracci at Bologna. Later on he came under the influence of Caravaggio, and for some years followed his naturalistic style; his later work, however, is more voluptuous. Many years of his life were passed in Rome, where Pope Paul V befriended him, but his masterpiece, a Nativity, is in the church of S. Martino, Naples, and he ended his career at Bologna, overwhelmed by debts incurred through gam-

Guido Reni, Italian painter

bling. He died Aug. 18, 1642. Guido was a most prolific and facile painter and engraver, and is amply represented in English and other European galleries. *See* Jesus illus., p. 4637.

Renmark. River port in South Australia. It stands on the river Murray, and has regular steamer communication with Morgan, 74 m. W., thence by rail to Adelaide. It is a prosperous centre of co-operative fruitgrowing on irrigated land, and was one of the earliest irrigation colonies.

Rennell. British island of the Pacific Ocean, in the Solomon Is. protectorate, 120 m. S. of Guadalcanal. It is inhabited by Polynesians of a primitive social order.

Rennell, JAMES RENNELL RODD, 1st BARON (1858-1941). British diplomatist. Born Nov. 9, 1858, and educated at Haileybury, and Balliol college, Oxford, he entered the diplomatic service in 1883. Ten years later he was in charge of the British agency at Zanzibar, remaining in Africa until 1901, having been special envoy to Menelik of Abyssinia in 1897, while acting as secretary of legation at Cairo. Councillor of embassy at Rome, 1901, he was British minister at Stockholm during 1904-08, and ambassador to Italy, 1908-19. Knighted in 1899, he was raised to the peerage as Baron Rennell of Rodd in 1933, having been Conservative M.P. for Marylebone during 1928-32. He died July 26, 1941, and was succeeded by his son, Francis James Rennell Rodd (b. Oct. 25, 1895). The first baron's published works included *Social and Diplomatic Memories* (3 vols.); *Customs and Lore of Modern Greece*; and several volumes of verse.

Renner, KARL (b. 1870). Austrian statesman. Born Dec. 14, 1870, he attended Vienna univ.,

entered politics in 1907, and in 1919 headed the Austrian delegation to the peace conference of St. Germain which after the First Great War laid down the frontiers and status of the Austrian republic. He was chancellor during 1919-20. He was elected first president of the Austrian parliament in 1931, but was imprisoned for a

Renfrewshire. The Scottish county mostly S. of the Clyde

time for high treason in 1934, when Dollfuss (*q.v.*) attempted to crush the Socialists. Leader of the Social-Democratic party, he headed the provisional government set up by the Allies at the end of the Second Great War in 1945, later becoming premier of a more representative government. At the end of the year he was elected president.

Rennes. Town of France, capital of the dept. of Ile-et-Vilaine, and of the former province of Brittany. It lies at the confluence of the rivers Ile and Vilaine, 232 m. by rly. W.S.W. of Paris, and is a rly. junction. It is the seat of an archbishop, and the headquarters of an army corps, with large barracks and arsenal. Rennes has a university and a national school of agriculture. The industries include tanning, and there are foundries and textile and printing works; and a trade in agricultural produce and livestock.

Rennes, France. Western facade of the cathedral completed in 1844

The chief part of the town lies on the right bank of the Vilaine. The cathedral, an old foundation, was begun in 1787 and completed in 1844. Other churches include those of S. Germain, 15th century, S. Sauveur, 1725, and of Notre Dame-en-S. Mélaïne, a 13th century abbey. The musée contains a notable collection of paintings and drawings by old masters. The palais de justice built 1618-54, was the meeting place of the old parlement of Brittany.

Rennes was the capital of the ancient Armorican tribe of the Redones. Capital of Brittany in the 9th century, its parlement was instituted by Henry II in 1551. A fire in 1720 destroyed many old buildings. The second Dreyfus trial took place in the Lycée, 1899.

Rennes was occupied by the Germans from June 17, 1940, until it was liberated, virtually undamaged, by American troops on Aug. 4, 1944. Pop. 113,781.

Rennet (Middle English *rennen*, to cause to run together). Extract from the lining of the fourth or rennet stomach of the calf. It is used for curdling milk in cheesemaking, and in the preparation of junket. The salted linings used in the preparation of rennet are known as vells. The curdling action is due to the ferment rennin, which causes the casein to coagulate and entangle the fat. Rennet also contains another ferment, pepsin, which plays a part in the ripening of cheese (*q.v.*).

Rennie, JOHN (1761-1821). British engineer. Born at Phantassie, East Lothian, June 7, 1761, and educated at Edinburgh university, in 1784 he obtained a position with James Watt, and the same year designed a steam engine in advance of all previous models. In 1791 he began as an engineer on his own account in London, carried out the construction of the Kennet and Avon, Rochdale, and other canals, and was responsible for the building or improvement of many docks and harbours, including the London docks, Hull docks, and the dockyards at Sheerness and Chatham, and the great breakwater at Plymouth. The old Waterloo bridge, London, replaced during 1825-42, was his masterpiece; London, Southwark, and Kelso bridges were also products of his genius. One of the greatest civil engineers of his time, Rennie was elected F.R.S., 1798, and died in London, Oct. 4, 1821.

His eldest son, George (1791-1866), extended the operations of the firm, adding shipbuilding on a large scale. His second son, Sir John Rennie (1794-1874), was also a distinguished engineer, and constructed works at Woolwich, Sheerness, Plymouth, etc., for the Admiralty. *Consult* Autobiography, 1875.

Rennin. Name given to a coagulating enzyme occurring in the gastric juices of man and the higher animals. An alternative name is chymosin.

Reno. City of Nevada, U.S.A., the co. seat of Washoe co. On the

Truckee river, it is 32 m. N. of Carson City, and is served by the Southern Pacific and other rlys. It is the seat of the state university, and has an agriculture experimental station. Farming, stock-raising, and mining are important local industries, and the city has manufactures of rly. plant, flour, lumber products, machinery, and plaster. Meat-packing and iron-founding are also carried on. Easily satisfied legal requirements for divorce and the short period needed to acquire Nevada citizenship (six weeks) have resulted in a widely known "divorce industry" at Reno. In 1945 there were over 7,000 divorces, though among permanent residents the divorce rate does not exceed the national average. Settled in 1868, Reno became a city in 1899. Pop. 21,500.

Renoir, PIERRE AUGUSTE (1841-1919). French painter. Son of a tailor, he was born at Limoges, Feb. 25, 1841. As a boy he painted flowers in a ceramic workshop. In 1861 he studied in Paris under Gleyre, meeting Sisley, Monet, Bazille, and Cézanne. He turned to Impressionism, first exhibiting at the Salon in 1864, and taking part in the Impressionist exhibition ten years later. As a result of his early interest in tone he tended to put the emphasis on colour without the sacrifice of light, and his paintings reflected his *joue de vivre*. To this period belong the *Odalisque*, and *La Loge*.

He then concentrated on rendering texture, and his sensual approach to nudes was first shown in the famous *Baigneuse* and *Moulin de la Galette*. One of his best-known works is *Les Parapluies* (in the Tate Gallery), a scheme of blue, lavender, and grey. After experimenting with a hard, emotionless style, he returned to the painting of rosy nudes. He produced some 6,000 paintings, and 155 lithographs. Renoir's art throughout is impetuous and spontaneous; there is little theorising; his life and art were completely one. His works are exhibited in the chief galleries of Europe and the U.S.A. He died at Cagnes, Dec. 3, 1919. *Consult* Lives, A. André, 1919; A. Basler, 1928; J. Meier-Graefe, 1929; C. Roger-Marx, 1933; P. Lund, 1945; Drawings, ed. J. Rewald, 1947.

John Rennie, British engineer

Pierre Renoir, French painter

Renown. British battle cruiser. Laid down in 1915, she was originally to be a battleship, but was designed afresh, and completed in 1916, at a cost of £3,000,000. In 1936-39 she was rebuilt and re-engined at much the same cost. Displacing 37,000 tons on a length of 787 ft. and a beam of 102 ft., she had geared turbines developing 120,000 s.h.p. to give a maximum speed of 32 knots. Armament consisted of six 15-in., eight 4.5-in., sixty 20-mm., and thirty 2-pdr. guns. Armour had been sacrificed for speed and armament and was considered too weak by Beatty, who refused to accept the Renown for service with the Grand Fleet until the plating had been stiffened.

During 1920-22 she took the prince of Wales on official visits to the U.S.A., Australia, New Zealand, India, and Japan, and in 1927 took the duke and duchess of York to Australia. Her first action in the Second Great War was with the Sehornhorst and Hipper off Norway in 1940. As flagship in the W. Mediterranean, she bombarded Genoa; and took part in the chase of the Bismarck. In 1943 Winston Churchill returned in the Renown from the U.S.A. The first meeting with German naval representatives to arrange the surrender in Norway took place on board her at Rosyth on May 7, 1945; and on Aug. 2 King George VI received President Truman on board at Plymouth. She was sold as scrap in 1947.

Rent (Lat. *reddere*, to pay). Money or other payment made for the use of land, houses, and other buildings. The economist regards rent as the share of production that falls to the lot of the owner of the land, as opposed to wages and interest that fall to the labourer and the capitalist respectively.

According to the theory of rent associated with the name of Ricardo, the amount of rent is fixed by an iron law. There is a class of land on the margin of cultivation, i.e. land which can only produce sufficient to pay for the labour and capital put into it. If any rent is charged, this land will fall out of cultivation. This serves as the basic line for rent, which rises or falls with the price obtained for the produce. A rise in prices will make it possible to cultivate land hitherto lying idle; a fall will have the opposite effect. Rent, therefore, is the surplus obtained from land, the amount it produces in excess of that produced by land on the margin; in other words, it is the difference between the total cost of the

product and its value in the market. It is none the less rent if paid to the cultivator who is the owner, and the principle still holds, even if custom does not allow the landlord to exact the full rent. An application of the same theory accounts for the high rent paid for building land in crowded centres, the so-called ground rent. It is the amount at which a man values the worth to him of an advantageous position over one that he can obtain for practically nothing.

Ricardo's idea is probably unassailable as a theory, but the intermixture of land and capital is so close that rent tends to approximate more and more to interest on money invested. There are, however, differences between rent and other forms of income, due to those between land and other forms of capital, and on these are based proposals for the special taxation of rents.

In the popular sense rent is the payment made for occupation of factories, houses, land, etc., and is therefore only a form of interest on capital. It is regarded as due in England and Wales on the four quarter days (*q.v.*). Landlords of small houses usually pay the rates thereon and include this amount in the weekly rent. If the rent is not paid on the appointed day, the landlord has the right of distress. In Scotland distress is not permitted, but the law provides other remedies. A rent charge is an income charged by will or settlement upon certain rents. Quit rents were payments made to lords of manors to free the tenant from miscellaneous charges. *See* Capital; Distress; Interest; Land; Landlord; Single Tax; Tenant.

Renter. One who occupies a property or accommodation by virtue of paying a rent; more commonly called a lessee or tenant. In the cinema industry, the term renter has the opposite meaning, denoting an organization which lets out films to exhibitors.

Rentes (Fr., yearly income; rent; annuity). The general term for French government stocks, roughly corresponding to the English Consols. The ownership of *rentes* is very widely dispersed among the French people.

Rentier (Fr.). Originally a holder of *rentes*, French govt. bonds. The term is now used to describe anyone who lives on the income from investments.

Renton. Town of Dumbartonshire, Scotland. It stands on the right bank of the Leven, 2 m. N. of Dumbarton, and has a rly. station.

The earlier industries of dyeing, bleaching, and calico printing are being superseded by light engineering works. The chief building is the parish church. Dalquhurn House, now pulled down, was the birth-place of Smollett, whose family owned land here, and whose sister founded the town. It was named after her daughter, who became Lady Renton. In the early days of club football the local team were world champions. Pop. 5,367.

Rent Restriction Acts. Series of statutes in the U.K. designed to prevent tenants from being evicted from their houses or having their rents increased except on specified grounds. The first Rent Restriction Acts were made necessary by a housing shortage during the First Great War. That of 1915 was passed as a temporary measure, intended to endure only until six months after the war and applying only to low-rated houses. It was extended and finally replaced by the more permanent Act of 1920 which applied to all but very large houses. To a large extent this has remained in force ever since. By 1923 houses were more plentiful, and a new Act introduced the principle that once a house became empty it was decontrolled and the landlord could let it on such terms as he pleased. In 1933 another Act automatically decontrolled the largest houses previously within the Act, but prevented further decontrol of the smallest. The law remained unchanged as to houses between these two extremes. In 1938, an Act decontrolled the largest remaining houses. On the outbreak of war in 1939 control was re-imposed over all houses whose rateable value did not exceed £100 in London, £90 in Scotland, or £75 elsewhere. Some important amendments were made by the Landlord and Tenant (Rent Control) Act, 1949.

The present state of the law is thus very complicated. One set of laws applies to houses which have been controlled since 1920 or earlier; another set to houses which before 1939 were not controlled, either because they never had been—e.g. they were built after 1919—or because they had been decontrolled. These laws do not apply to furnished houses.

The main grounds on which a landlord may recover possession from a tenant are (1) that the tenant is in arrears with his rent; (2) he is causing nuisance or annoyance to adjoining occupiers; (3) he has assigned or sublet the whole house without the land-

lord's consent; (4) the house is overcrowded contrary to Housing Acts; (5) it is reasonably required by the landlord as a residence for a whole-time employee or an agricultural worker; (6) it is reasonably required by the landlord to live in, or for his son, daughter, father, or mother; (7) there is suitable alternative accommodation. In no case is the court bound to give the landlord possession.

These Acts have also prevented the landlord from increasing the rent except on certain grounds. Again, houses which were controlled before Sept., 1939, are in a different position from those brought under control in that year. For both classes there is a standard rent, normally the rent at which the house was let on Aug. 3, 1914, in the case of old-control houses, and Sept. 1, 1939, in the case of new-control houses. The standard rent of houses let for the first time after Sept. 1, 1939, may now be fixed by a rent tribunal. To this the landlord may add the amount by which the rates have increased since 1914 or 1939; he may also add a percentage of expenditure on improvements (not mere repairs) since either date (6 p.c. on expenditure before July 2, 1920, 8 p.c. after). For old-control houses he may also add 40 p.c. of the net rent in 1914 where he is liable for repairs, and 15 p.c. where he is not. The net rent, where the landlord pays the rates, is the amount of the standard rent less rates.

The Acts also give certain protection to mortgagees in respect of increase of mortgage interest and of calling in the mortgage.

Rent Tribunal. Local tribunal under the ministry of health. It can give tenants of furnished premises three months' security of tenure, and can fix reasonable rents for furnished premises, and standard rents for unfurnished premises first let after Sept. 1, 1939.

Renwick, JAMES (1662-88). Scottish Covenanter. Born at Moniaive, Dumfriesshire, Feb. 15, 1662, he was educated at Edinburgh and Groningen, where he was ordained. From 1683 he preached in Scotland, but was outlawed by the privy council of Edinburgh. His open repudiation of the claims of James VII to the throne led to his arrest, and he was hanged, Feb. 17, 1688.

Repairs. By English law the liability to execute necessary repairs to a house is almost entirely a matter of contract. Land-

lord and tenant are each liable to carry out repairs for which they have undertaken liability in the tenancy agreement, and are not liable for other repairs. Thus it frequently happens that neither can compel the other to carry out some repair. There are exceptions to this rule. With houses let at a rent not exceeding £40 in London or £26 elsewhere it is implied, in spite of any provision to the contrary in the tenancy agreement, that the house is reasonably fit for human habitation at the beginning of the tenancy and that the landlord will keep it in such repair during the tenancy. With all premises let furnished it is implied, in the absence of contrary provision in the tenancy agreement, that the premises are fit to be lived in at the beginning of the tenancy; but there is no implication that the landlord will be responsible for defects developing during the tenancy. With flats it is implied, in the absence of any provision to the contrary, that the landlord will take reasonable care to ensure that portions of the building not let to the tenant but regarded as retained by the landlord for the convenience of the tenants of all the flats are in good repair. Thus he is liable if because of his lack of care the roof is defective.

The Landlord and Tenant Act, 1927, limits the damages which a landlord may recover for failure to repair to the amount by which the value of the reversion has been diminished. This may mean that no damages at all are recoverable, e.g. where the district has ceased to be residential. Nor are any damages recoverable if the premises are shortly to be pulled down or structural alterations are to be made that would render the repairs valueless. The Leasehold Property (Repairs) Act, 1938, protects tenants of houses with a rateable value not over £100 by providing that where five years or more of the lease remains unexpired, the landlord cannot exercise any rights against the tenant in respect of breach of a covenant to repair unless he obtains the leave of the court. See Landlord; Rent Restriction Acts.

Reparations (Lat., *reparare*, to repair). Term introduced during the First Great War and used later to indicate the means by which Germany should make compensation for damage and loss caused to civilians during the war. Reparations were to be made in money and in kind (coal, machin-

ery, livestock, existing shipping and new ships, etc.). The payment of reparations was to be supervised by an inter-Allied reparations commission. In January, 1921, the financial council of the Allies assessed total reparations at 132 milliard gold marks (£6,600 millions). This Germany failed to fulfil. In 1924 the Dawes Plan (*q.v.*) and in 1929 the Young Plan (*q.v.*) were introduced, but German economy still did not revive, and it was agreed in 1932 at a conference in Lausanne that reparations should be cancelled, and that Germany should instead deposit with the bank for international settlement gold bonds, secured on the German railways, to the value of £150 millions. These bonds were to be marketable from 1935 to 1937, and were to bear interest at 5 p.c.

The attempts to secure reparations from Germany for the incalculable damage to property and loss suffered by civilians during the Second Great War took the following forms: (a) the employment of Germans in the work of reconstruction in devastated regions, or in the manufacture or agriculture of the victorious country; (b) the dismantling and removal of factories, plant and machinery, vehicles, stocks of materials, etc., for use in the country of one of the Allies; (c) the working in Germany of factories, etc., for the benefit of the occupying power; (d) the dissemination among the Allies of valuable technical information secured by investigating commissions. It is doubtful whether the Western Allies received benefit at all comparable with the vast sums they expended to maintain the industrial population of the zones they occupied. The Russians were stated to have secured reparation on a considerable scale. It would probably be impossible for the German nation to make such reparation as would constitute complete restitution.

It was cogently argued by Sir Norman Angell, Lord Keynes, and others, that in the modern world reparations are a myth, and that the attempt to secure them must really injure the victors as well as the vanquished. Consult The Great Illusion, Norman Angell, 1911; The Economic Consequences of the Peace, J. M. Keynes, 1919.

Repatriation. Act of returning a forcibly removed person to his or her country of origin. Repatriation became a major international

problem after the Second Great War, and involved the movements of millions of displaced persons, and the return to their own countries of large numbers of released prisoners of war. See Displaced Person.

Repertory Theatre. Theatre which maintains a regular company performing standard plays for limited runs. The Théâtre Français (*q.v.*) is the archetype; there was repertory in Paris, Vienna, Berlin, and other Continental places before the idea was adopted in Great Britain. Here the beginning may be dated 1891, with the founding of The Independent Theatre, by J. T. Grein, and of The Stage Society. The repertory theatre is organized to pay its way rather than to make profit. The players are professional, though there are amateur repertory companies which may have their own theatres. The plays have theatrical, artistic, and educational merits. Since the Second Great War the tendency has grown to make the run two or three weeks instead of one.

Playgoers' societies, play readings, and other activities are often organized by repertory theatres. St. John Ervine, as Shute lecturer on the art of the theatre at Liverpool university in 1923, advocated the grouping of repertory and touring companies so that each would require to give a new play only once in three or four weeks. The nucleus of the group system was created by the Arts Council's West Riding theatre, with three interchangeable repertory companies at Halifax, Huddersfield, and Wakefield; also by its introduction of the Old Vic company to Bristol's Theatre Royal, where a production plays for three weeks and then visits either Bath or Weston-super-Mare. In 1946 Amersham repertory began to exchange productions weekly with Guildford. Dundee repertory experimented successfully with running a show for a fortnight.

Liverpool Playhouse, founded in 1911, is the oldest existing repertory theatre in Great Britain, but the third to be started, its predecessors having been Miss Horniman's Manchester repertory at the Gaiety (1908) and the Glasgow repertory theatre (1909). In 1939 The Stage list of such theatres included 75 companies; in 1946, 220. Some of these were seasonal, but permanent companies numbered 100. Glasgow Citizen's theatre, founded by James Bridie in 1943 to give

"plays of artistic or didactic merit which would not otherwise be seen in Glasgow, of a quality sufficient for Scottish dramatists (if any) to write up to," is a pioneer Scottish enterprise. About 1,500 shareholders own the Liverpool Playhouse, which prospered increasingly after William Armstrong (*q.v.*) was appointed producer and director in 1922. West End stars produced by him were Diana Wynyard, Mary Hinton, Catherine Lacey, Marjorie Fielding, Judy Campbell, Robert Donat, Rex Harrison, Michael Redgrave, Herbert Lomas, Robert Speaight, Cecil Parker. The Old Vic took over the theatre 1942-46, after which the directors resumed control, Armstrong becoming assistant director at the Birmingham repertory.

Birmingham repertory really began in the dining-room of Barry Jackson's (*q.v.*) house, where Foot's The Liar was performed in 1903. Then amateur productions were given; and in 1913 the Birmingham repertory theatre was opened. First productions there have included the complete cycle of Back to Methuselah; Drinkwater's Abraham Lincoln; and Boughton's The Immortal Hour.

Miss Horniman started the Abbey Theatre (*q.v.*) in Dublin in 1903 "to encourage and to stimulate local talent." Her work at Manchester "discovered" Stanley Houghton, Allan Monkhouse, and Harold Brighouse as dramatists; Dame Sybil Thorndike, Lewis Casson, Irene Rooke, Milton Rosmer, were with the Manchester repertory early in their stage careers. Other players who acknowledged having had their chances in repertory companies included Edith Evans, Flora Robson, John Gielgud, Gwen Ffrangcon-Davies, Sir Ralph Richardson, Sir Cedric Hardwicke.

The Oxford Playhouse was started by J. B. Fagan in 1923, and the Cambridge Festival Theatre, opened in 1926, was founded to destroy the influence of what the director, Terence Gray, described as "the old game of illusion and glamour and all the rest of the 19th century hocus-pocus and bamboozle." The Vedrenne-Barker season at the Court Theatre, London, 1904-07, is referred to as "repertory"; there 988 performances of 32 plays were given.

Harold Downs
Bibliography. The Organized Theatre, St. J. Ervine, 1924; The English Theatre, A. Nicoll, 1936; The Other Theatre, N. Marshall, 1946.

Repington, Charles A. COURT (1858-1925). British soldier and military critic. Born Jan. 29, 1858, he went to Eton and Sandhurst, and into the Rifle Brigade in 1878. After serving in Afghanistan, Burma, and the Sudan, he entered the War office intelligence dept., and was for a time military attaché at The Hague. During the S. African War he was on Buller's staff, but was invalided home. In 1902 he left the army with the rank of colonel, and joined The Times as military critic, transferring to the Morning Post in 1918. After publishing some Memoirs in 1919, he produced in 1920 the work by which he is best remembered, The First World War, incorporated the so-called "Repington Diaries." The book caused considerable controversy by its revelation of a background of social gossip and "string-pulling" to the policies and events of the war, as well as by its own indiscretions of criticism. But it is valuable as a contemporary social document. Repington died May 25, 1925.

Replevin (Old Fr. *re*, again; *plevine*, warranty, from late Lat. *replegium*). In English law, a personal action to recover possession of goods or chattels taken or detained unlawfully or without sufficient cause. Action of replevin, usually but not solely applicable to distraint for rent, is now almost obsolete, being replaced by action for damages for illegal distress. See Distress; Pound; Rent.

Reporting. In journalism, writing reports of public speeches or descriptions of events of public interest. Notable examples are the reporting of parliamentary proceedings, trials in the law courts, and cases in the police courts. The term is applied also to the official reporting of parliament (see Hansard). Reporters of legal trials are often barristers. Newspaper reporting is of a most varied character, and calls for equally varied qualities on the part of the reporter. Usually, while on country newspapers the reporter finds himself called upon to put his hand to all branches of reporting, on the great daily papers the work is divided among descriptive writers, who specialise in particular branches—e.g. sport or industrial affairs—and shorthand writers, whose task is to record verbatim the utterances of public speakers.

During the 20th cent. verbatim reporting was reduced to a minimum, and confined to the record-

ing of speeches of primary importance or of trials of a sensational character, the formal record of which was introduced by a descriptive summary. The work of the average reporter consequently changed from a mechanical occupation, in which accuracy was the chief quality demanded, to one in which the power of succinct descriptive writing was of the first importance. At the same time a knowledge of shorthand on the part of the reporter, though he might not be called upon to use it often, was occasionally invaluable. See Journalism ; Newspaper ; Shorthand.

Repoussé. Art of ornamenting thin sheets of metal by hammering out designs from the back of the sheet. Practised by the ancient Egyptians and the Etruscans, it reached its highest perfection in the 18th century, in the time of Cellini (*q.v.*), who was perhaps its greatest exponent. In carrying out the art a large number of small hammers of varying sizes and weights are used, the handles of the hammers being as elastic as possible, in order that they may respond to the lightest touch of the craftsman. When the design has been hammered out from the back or the inner surface of the article, the raised portions are generally finished by gravers or chasers. As the metal usually has been hammered out very thin, a backing of pitch is attached to provide a firm bed for the engraver to work upon. The metals which have chiefly been used in this art are gold—peculiarly suitable—silver, copper, tin, pewter, and lead. Some beautiful examples of repoussé work are in the Victoria and Albert museum at S. Kensington, London.

Representation (Lat. *re*, again; *præsentare*, to present). In politics, the method by which people entrust the duties of legislation and government to men and women of their choice. In theory it gives those representatives a greater freedom of action than is enjoyed by mere delegates or the holders of proxies. The representatives are chosen by some form of ballot. (See Election.)

Representation in the modern sense was unknown in the civilization of the ancients. There the citizen and freemen acted, whenever necessary, in person, but if a choice had to be made, it was usually done by lot or went by seniority. Kings and priests may be said to have represented the people, but not in the modern sense of the word.

The existing system began probably in assemblies of the Church, and appeared soon in the secular affairs of Teutonic peoples. In England the reeve and four men were summoned from each vill to answer for the state of that community, and the principle was quickly extended. The jury was representative. Then came the summons of knights of the shire to parliament and, a most important

Repoussé. Breastplate of Philip IV of Spain, now in the Victoria and Albert Museum, South Kensington

step, their election to the county court. These were representatives, although the word itself was not used for them until the seventeenth century.

About the end of the 18th century the ideas of the French Revolution gave new form to the theory of representation, and in the 19th century almost every kind of local authority became a body of elected representatives. Previously J.P.s had been representatives, although not elected, and before that time the lords of feudal times had represented their vassals before the king or other overlord. Most

European nations followed England in making use of political representation, while the system was carried by British emigrants into the countries in which they settled. See Democracy ; Franchise ; Government ; Politics.

Representation of the People Acts. Official designation of Acts of parliament governing parliamentary suffrage in the U.K. The chief Acts have been those of 1918, 1928, 1945, and 1948. See Commons, House of ; Franchise ; General Election ; Redistribution ; Reform Acts.

Representative Peer. One of sixteen members of the Scottish peerage who sit in the house of lords. Scottish peers are not members of this house by right, so for each parliament sixteen are elected by the entire adult peerage of Scotland specially convened for that purpose. Until the establishment of the Irish Free State, 28 representatives from the Irish peerage were similarly chosen, but as life members, to sit in the house of lords, and some Irish peers elected before 1920 still retain their seats, though no elections are held to fill vacancies.

Representatives, HOUSE OF. Lower house, or popularly elected house, of the congress of the U.S.A. Its membership varies in number from time to time, being settled every ten years on a population basis. At the 1948 election it numbered 435. An election takes place every two years, the qualifications of the voters, who include men and women, varying from state to state, while the necessary period of residence also varies. According to the constitution, members of the house must not be under 25 years old, and must reside in the state which chooses them. Custom also requires them to reside in the constituency they are chosen to represent.

The house is presided over by a speaker, and all legislation must be approved by it ; but it differs from the British house of commons in excluding from membership all who hold ministerial office. Members receive a salary of \$12,500 a year and travelling and other expenses. They are divided into parties, the two most important being Democrats and Republicans. (See under those names.)

The elected chamber in the parliament of the Australian commonwealth is also called the house of representatives. It consists of a varying number of members, regulated according to the most recent census, but no state can have fewer

than five. In 1948 the number of representatives was 74. They are elected for three years unless the house is dissolved earlier. Some of the representative assemblies in New England states in the 17th century were called by this name.

Repression (Lat. *reprimere*, to check). Psychological term meaning the driving of some piece of knowledge from consciousness by an automatic and unconscious process. It should not be confused with suppression, which is deliberate. The extreme case of repression is the complete amnesia which may follow a violent shock, e.g. being blown up by a bomb. Every type of mental material, however, may be more or less subject to this process—beliefs, wishes, feelings, as well as memories. Complete amnesia is far rarer than partial repression. Displays of excessive and irrational anxiety may be signs that people possess repressed memories of earlier events which caused fear, while not being able to control the emotion itself. Repressed material does not cease to exist. It remains in the unconscious (*q.v.*) mind unless recalled by some form of psychiatric treatment. During sleep, or when the external circumstances resemble those which caused the original repression, the buried elements struggle to return to consciousness. A soldier suffering from amnesia may shout, scream, or wave his arms in his sleep, i.e. he will tend to reproduce as far as possible the gestures and noises he was making just before repression took place. As a rule, however, repressed material can return only in disguise. Repressed material issuing in such distorted form may have influence on daily life. Choice of occupation or of a marriage partner, political beliefs, hobbies, family relations, etc., may be affected by these unconscious mental conflicts.

The agent of repression is the super-ego (*q.v.*). This mechanism floods the conscious mind with unbearable anxiety or shame when wishes or feelings appear which are strongly forbidden by one's moral code. Repression is the first line of defence against this anxiety, and where it is rational it is a useful force in normal life. As repressions multiply, however, the activities will tend to become more and more restricted as complexes grow. See Complex.

Reprieve. In law, withdrawal of the sentence on a prisoner for an interval of time whereby the execution is suspended (Blackstone). This may be done by the judge

when he is not satisfied with the verdict or with the legality of the conviction. A reprieve is granted in all cases where the prisoner becomes *non compos mentis* between the judgement and the award of execution. There is another form of reprieve, by the royal grace, which is part of the king's prerogative of pardon, and in every country the head of the state has the power of reprieve by way of grace. See Pardon.

Reprisal (Fr. *représaille*, from Lat. *reprehendere*, to take again). Retaliation or vengeance. In international law the word has two meanings. During peace, reprisals are injurious acts committed by one state against another to compel that other to remedy some real or alleged misconduct of which it has been guilty. Thus where one state has broken a treaty the other party to the treaty may, in order to obtain redress, take steps which otherwise would be illegal—e.g. seize the ships of the first state. During time of war, reprisals are acts contrary to the rules of war committed by one belligerent against another as retaliation for illegal acts committed by the first belligerent. The object is to compel that belligerent to cease committing illegal acts. Thus a belligerent may be induced to refrain from infringing the rules of war by the fear of the reprisals that might follow an infringement. On the other hand, reprisals, being acts contrary to the laws of war, may themselves lead to counter-reprisals, and these to further reprisals, and on this principle almost any of the laws of war may be broken.

During the First Great War, the Germans attempted to justify many of their atrocities in Belgium as reprisals for the killing of their troops by civilians. In the Second Great War, Great Britain on Nov. 27, 1939, issued an order for the seizure of goods at sea loaded in German ports as a reprisal for German mine-laying and submarine warfare. The Hague convention of 1929 prohibited the taking of reprisals on prisoners of war.

Reproduction (Lat. *re*, again; *producere*, to bring forth). Term for the biological process by which new organisms arise from pre-existing ones. The simplest methods of reproduction are to be found among unicellular organisms. Many of these split into halves (binary fission), thus doubling

their number and halving the chance of accidental death. Concomitantly the volume of the cell is halved, but its surface in proportion to its volume is increased and so affords a relatively greater facility for exchange of material between the protoplasm and its environment, and consequently a possibility for acceleration of life processes generally. When the products of fission grow quickly and repeat the process at short intervals the rate of production of new individuals exceeds the rate of accidental death and the race multiplies, often rapidly. For example, many bacteria may divide again 30 mins. after they were formed in the previous fission. A continuation of reduplication at this rate, did all individuals survive, would in ten hours give more than a million offspring from an original one. Such a rate is, however, not maintained. The consequent drain on the food supplies and rising concentration of waste products in the surroundings impose a limit to numbers, though this limitation may be delayed by the spreading of individuals.

Reproduction by Spores

Asexual spore formation is another method of reproduction which is also potentially one of rapid multiplication. It is common among algae and fungi, and to a somewhat lesser extent among the lower animals. It resembles fission intrinsically in that the new organisms are initiated by the separation of parts of the protoplast of an older one, but differs in that usually more than two are formed at a time. In some instances, as in fission, the whole of the parental protoplast is shared among the offspring; in others, especially when the body of the organism is extensive, part is not used in the process and may continue its existence to reproduce again later. In some few cases, e.g. in *Volvox*, the spores produced in one structure retain contact and so grow into a colony, but in most the simultaneous production of numerous offspring necessitates their dispersal to avoid overcrowding. Many algae, e.g. *Oedogonium*, and water-inhabiting fungi, e.g. *Saprolegnia*, though themselves non-motile, form asexual spores which swim and so scatter. The fungi, such as the pin mould, which grow in relatively dry conditions, form non-motile spores that are readily carried as dust in the wind. The probability that

some of these wind-borne spores will alight in situations suitable for development may be gathered from the estimate that a fair sized mushroom liberates some 1,800,000 spores. The scattering, however accomplished, confers on each new organism a chance of starting life untrammelled by the previous generation and relieved of excessive competition from its fellows. Moreover when spores are dispersed some distance, opportunities arise for the establishment of the race in a new locality, i.e. migration occurs.

The process of budding, characterised by the formation of outgrowths from the parent, may lead to the production of young, either as single cells or as organized groups of cells. The former occurs, for example, in the unicellular yeast plant and in the Foraminifera, the latter in some liverworts, Hydrozoa, and several groups of worms. The buds may separate immediately they are completed, or remain attached to form a colony which may be a temporary association, as it is in yeast, or the characteristic form of the organism, as in many of the sedentary Hydrozoa. Some of the buds in the colonies of these animals become special sexual individuals, and sometimes these swim away like tiny jelly fish. A similar specialisation of buds for sexual reproduction occurs in some of the marine worms whose tail end breaks off as a freely swimming unit. The Palola of S. Pacific reefs regularly with the dawn of the last day of the last quarter of the Oct.-Nov. moon breaks off the tail half of its body. The surface water becomes alive with these swarming fragments, which shed their eggs and sperm in it.

Vegetative Reproduction

Somewhat analogous to budding is the process of vegetative reproduction which occurs in many of the higher plants, though it is by no means confined to them. New strawberry plants arise from buds on the runners of old ones; potato plants sprout from tubers. A part of the parent plant grows out and becomes separated. Under natural conditions the incept for the new individual is located where it is to grow at a short distance from the parent before the connexion between decays. Structures such as rhizomes and tubers, which facilitate vegetative reproduction, frequently also serve as depositories for food, and so afford the offspring ample nourishment during their period of establishment.

In many instances they remain dormant through inclement periods and develop only when conditions are favourable for vegetative activity. These features of vegetative reproduction confer a surety which outweighs any disadvantage due to the few offspring initiated.

Sexual Reproduction

Among the lower organisms, reproduction by simple asexual means is the rule. Most organisms, however, resort periodically to sexual reproduction, in higher animals the only method available. This process involves a twofold reorganization in the production of the two kinds of gamete and perhaps, in their fusion, an additional stimulus to development which, however, may not be immediately effective. The zygote may pass into a resting condition, to renew its activity some time later. Sexually produced young tend to differ from their progenitors on account of the reassorting of genes during the meiotic divisions which lead to the formation of gametic nuclei, and in that additional sense they are usually new organisms. This is true even when they are the product of one bisexual self-fertilised parent, unless that parent is also completely homozygous, and so sexual reproduction brings variety in its train. The new generation may also differ from its immediate forebears in the way it reproduces. In ferns, for example, the gametes are formed by inconspicuous plants called prothalli, but the zygote develops into an ordinary fern plant, the fern in due course producing spores which grow up into prothalli again. Alternation of generation is the rule in all plants except thallophytes, though in seed plants it is obscure because the sexual generations are contained within the ovules and pollen grains.

Seeds which normally form only after a fusion of gametes inside them may be produced in large numbers—the foxglove produces some 80,000 per plant—and may be dispersed in various ways. A life cycle comprising more than one generation is common among the protozoa, where variations in it and of the form assumed by individuals at different times may be related to changes in the environment as well as distribution and gamete formation. More than one generation is the exception among the metazoa, meiosis and gamete formation occurring usually just before syngamy. The highest animals are in general the

least prolific and secure dispersal in the adult condition. Despite the prevalence of sexuality in most races, gametic fusion is not always essential to development. Numerous instances of parthenogenesis involving development from unfertilised eggs are known, and for this reason syngamy is by some considered as a process facilitating variation, but not an intrinsic part of reproduction.

As has been said, the reproduction of the higher animals is sexual. In mammals and some other forms of animal life fertilisation of the eggs is internal, necessitating the passing of male sperms into the body of the female. This is accomplished at copulation by the insertion of the male intromittent organ, or penis, into the female vagina. The spermatozoa from the male reproductive organ, the testes, are set free either in the vagina or, in some forms, in the uterus. They are contained in a complex fluid medium derived from the prostate and associated glands. The fluid, together with the spermatozoa, is called the semen or seminal fluid. At body temperature and in the presence of oxygen, the sperms are active, and swim up through the oviducts to meet the eggs.

REPRODUCTION BY ARTIFICIAL INSEMINATION. If the seminal fluid of animals is cooled slowly, the sperms become inactive, especially if oxygen is withheld from them. In this state the seminal fluid may be kept a long time. On being warmed and on the readmission of oxygen, the sperms resume activity. If the seminal fluid is then inserted in the vagina of a female who has eggs ready to be fertilised, the probability is that they will be fertilised. Seminal fluid thus used artificially may be diluted at least 8 times with success, so that many more horses, for example, can be obtained from a sire by this means than by natural mating. The semen, similarly treated, can be transported for long distances. Development of a process for the artificial insemination of queen bees was undertaken with the object of improving the races used for honey production.

Artificial insemination among human beings is occasionally adopted in childless marriages where the male partner is infertile, or by an unmarried woman wishing to have a child. It should be contemplated only after very careful consideration and under adequate medical and legal safeguards.

Reptile (Lat. *reptilis*, crawling). Class of back-boned animals (Vertebrates) with cold blood, which breathe air by means of lungs and are reproduced by eggs, which are sometimes retained in the body until ready to hatch. The class consists of five existing orders, but fossil reptiles constitute as many more orders. Of existing orders one is represented solely by the iguana-like *Tuatera* (*Sphenodon*) of New Zealand, the second by the tortoises and turtles, the third includes the crocodiles and alligators, the fourth the lizards, and the fifth the snakes. Formerly the amphibious animals (*Batrachia*) were classed as reptiles, as they are still re-

With the exception of some herbivorous tortoises, all the reptiles are carnivorous, their food ranging from mammals to insects and worms. In the turtle and tortoise the upper and under sides are protected by great shields, formed by modifications of the skeleton and covered with thin plates of horn. In the crocodiles ordinary scales are more apparent on the feet; on other parts there are bony plates formed in the skin. In the lizards and snakes the scales are mostly small, horny, and overlapping, outgrowths from the skin, with which they are shed from time to time. See *Animals*, colour plate; also *Chameleon*; *Crocodile*; *Gecko*; *Iguana*; *Lizard*; *Snake*, etc.

Reptile. 1. Viscera of a serpent: A. Mouth. B. Gullet. C. Trachea. D. Lung. E. Liver. F. Stomach and intestine. G. Egg. H. Ovary. J. Cloaca. K. Vent. 2. Skeleton and carapace of a logger-headed turtle, from beneath. 3. Skeleton of a snake. 4. Skeleton of common lizard

Repton School. English public school. It owes its origin to Sir John Port, of Etwall, who left money to found a grammar school, and this was opened at Repton, Derbyshire, in 1557. In the 19th century it developed into a leading public school, and has now over 400 boys. They live in eight houses, and there are classical and modern sides, as well as an army class, and other kinds of special training. The school has entrance scholarships, and several to assist those leaving the school to enter the universities.

Repton School arms

Republic (Lat. *res publica*, public affairs). Form of the state in which the supreme authority is vested in the citizens, or a privileged class of citizens. It is thus opposed to a monarchy, the head of which derives his power from hereditary descent. The distinction is not always rigidly maintained,

Repton, Derbyshire. School buildings, with remains of priory on left, and Pears School, built in memory of a former headmaster. Top, left, parish church of St. Wystan

Valentine

garded in the popular view; but the soft glandular skin, devoid of scales or plates, and the fish-like larval stage separate them. The skull is bony, and the jaws furnished with teeth, except in the turtles and tortoises, where they approximate more to a bird's bill.

for the elective monarchy of Poland was called a republic.

The city-states of the ancient world were mostly republics, which generally succeeded earlier monarchies. Some were aristocratic and some democratic, i.e. the politically privileged classes were small or large, but none were democratic in the modern sense, there being no representative machinery, and large classes—slaves, resident aliens, and others—being without political rights.

The weakness of the medieval empire allowed the rise of republican city-states in Italy, of which the strongest was the close oligarchy of Venice, and the most brilliant and turbulent the democracy of Florence. At the same time city republics arose in Germany and the Low Countries, and formed federations, notably the Hanseatic league, three members of which, Hamburg, Lübeck, and Bremen, maintained the medieval type in a modified form until modern times. San Marino and Andorra are two other remarkable survivals. More democratic, although often tending to oligarchy, were the Swiss cantons, which in the 14th century formed a federation, the model of the modern federal republic.

The republic of the United Provinces of the Netherlands, 1581, set an example followed by the British Commonwealth, 1649.

Modern Republics

The modern democratic republic begins with the adoption of federal republicanism by the British colonies in North America, 1776, soon followed by the centralized French republic, 1793, which, while itself passing into the Napoleonic empire, endeavoured to found daughter republics in other countries. The U.S.A. and France consciously imitated the austere simplicity belonging to the republican traditions of ancient Greece and Rome. Latin America followed the U.S.A. with republican constitutions, some federal, others centralized.

A period followed in which the monarchical principle gained ground, though Brazil became a republic in 1889, Portugal in 1910, and the venerable Chinese empire transformed itself, nominally at least, into a federal republic of the American type in 1912. The First Great War, with the collapse of the continental empires, made Europe and the world predominantly republican, federal republics being then established in Germany and Austria; centralized republics in Poland, Czecho-Slovakia, Finland,

the Baltic states, and the Caucasus; and an entirely new type, the Soviet republic, in Russia and her remaining dependencies. Later Spain, and various Balkan countries, which had retained their monarchies, became republics, and after the Second Great War Yugoslavia and Rumania voted for republican constitutions. In 1937 the Irish Free State adopted a republican constitution and resumed the ancient name of Ireland, Eire, remaining however, associated as to external affairs with the British Commonwealth. See Democracy; Federalism; Government; Oligarchy; Politics; Soviet.

Republican. River of the U.S.A. Formed by two forks in E. Colorado, it follows a N.E., E., and S.E. course, uniting with the Smoky Hill River at Junction City to form the Kansas River. It is more than 500 m. long.

Republican. Political party in the U.S.A. The party organized by Jefferson bore this name, 1825–30, though it became afterwards the Democratic party. The existing Republican party dates from the anti-slavery agitation. It developed from a union of Whigs, Democrats, and others, men who were against the extension of slavery, and the name Republican was adopted in 1854.

The party secured the election of Lincoln as president in 1860. It controlled American politics to the full extent of electing a president and dominating the senate and the house of representatives until 1874. The control of the latter house was lost in 1874, but the Republicans kept their hold upon the presidency until the election of Cleveland, a Democrat, in 1884. From 1888 they were again in power, but they were beaten in 1892. In 1896 the party had majorities in both houses of congress, and their candidate was elected president. In 1904 their candidate, Theodore Roosevelt, was again successful, as was Taft in 1908. In 1912 Roosevelt and his followers broke away from the party and enabled the Democrats to bring about the election of Wilson and to obtain a majority in both houses. The Republicans regained the presidency with Harding in 1920 and kept it with Coolidge in 1924 and H. Hoover in 1928. In 1932 the Democrats regained control under F. D. Roosevelt. From 1946 a predominantly Republican congress was in conflict with a Democratic president (H. S. Truman).

The leading features of the Republican programme have been

the strengthening of the central government as against the local spirit of the separate states; the maintenance of a gold standard; and the protection of American manufactures by a tariff system. At the end of the First Great War the party opposed the entry of the U.S.A. into the League of Nations.

Repulse. Former British battle-cruiser. A sister ship of the *Renown* (q.v.), she was laid down in Jan., 1915, and completed in Aug., 1916. Like the *Renown*, and for the same reason, she saw little service in the First Great War. While operating with the Prince of Wales (q.v.) off the coast of Malaya she was sunk by Japanese aircraft on Dec. 10, 1941.

Requena. Town of Spain, in the prov. of Valencia. It stands on a hill, 25 m. direct and 47 m. by rly. W. of Valencia. It has relics of the old town walls, and a church dating from the 13th century. The S. part with its narrow tortuous streets and manorial houses retains a medieval aspect. Silkworms, vines, cereals, fruit, and saffron are cultivated. In the vicinity are the mineral baths of Fuente Podrida. Pop. 20,700.

Requiem. Name given to the Mass for the dead (*Missa pro defunctis*), the word being the first of the introit of this office—*Requiem aeternam dona eis, Domine*—Grant to them eternal rest, O Lord. The requiem mass, which is sung on All Souls Day, Nov. 2, is celebrated with black vestments, and the Credo and Gloria in Excelsis are omitted. Music for sung requiems has been written by many great composers, including notably Palestrina, Vittoria, Mozart, Cherubini, Berlioz, Brahms, Verdi, Fauré, and Stanford.

Reredos (rear; Fr. *dos*, Lat. *dorsum*, back). In ecclesiastical architecture, the screen or wall at the back of an altar. Originally it was merely a hanging of silk or tapestry suspended from hooks in the walls or ceiling of the sanctuary, and in this form it was subject to frequent changes, corresponding to alterations in ritual. In the Middle Ages it became more substantial, but was still movable; it was customary to use it only for certain festivals of the year. The *Pala d'Oro*, in S. Mark's, Venice, is a reredos of this description. With the middle of the 16th century, the fixed reredos came into use.

In England it assumed early a more definitely architectural character, and was covered with elaborate Gothic detail—niches with figures of angels or saints,

Reredos in Winchester Cathedral, probably begun in the 15th century, and restored 1884-91

tabernacle work, and symbolic carving of every kind. The 14th century reredos in Durham cathedral, the 15th century in the chapel of All Souls, Oxford, and the one at Winchester are fine examples of this architecture. *Pron.* rear-doss. *See* Altar.

Reschen Scheideck. Alpine pass of the Italian Tirol. On the road from Landeck to Meran, alt. 4,902 ft., the pass is near the village of Reschen, and $3\frac{1}{2}$ m. S. of Nauders, near the Gruben Joch, where Switzerland and Italy meet. The road is often called the Finstermünz Pass, but this point lies some 2 m. N. of Nauders. The route was known in pre-Roman times.

Rescript (Lat. *rescripta*, written back). In Roman law, a written answer sent by the emperor to magistrates and other officials who applied to him for information and advice, and, less commonly, to parties in a litigation who similarly appealed to him. Rescripts differed from *decreta*, which were decisions upon doubtful points of law referred to the emperor as the highest court of appeal, but with the *decreta*, the *edicta* (ordinances with regard to matters in which new legislation seemed to be required) and the *mandata* (instructions to magistrates), formed the four classes of *constitutiones principum*, imperial constitutions, which had the force of law. The rescripts were preserved by Justinian in his Institutes. Rescript is the technical term for a decretal epistle from the pope on points of doctrine or discipline. *See* Decretal.

Rescue (Lat. *re*, away; *excutere*, to shake out). Deliverance from danger or violence. The word is used for the forcible release of a prisoner which is an offence against the law (*v.i.*); also for relief from a violent death. Rescue appliances are provided in case of an explosion in a mine or disasters at sea; fire brigades come into the same category. Heavy and light rescue squads for the recovery of air raid victims were maintained by the Civil Defence (*q.v.*) organization of the Second Great War. Rescue work is a term used for the efforts to dissuade women from the career of prostitution. A great deal of this is done in large cities by the Salvation Army and other social and religious agencies, and there are many so-called rescue homes. *See* Air-Sea Rescue; Fire Brigade; Lifeboat Institution; Life-Saving Society; Salvation Army.

Rescue. In law, taking away and setting at liberty out of the custody of the law either a person who is in the custody of the law or a distress rightfully taken. Rescue is a misdemeanour. But if a private person arrest another, it is no offence to rescue him unless the rescuer has notice (knowledge) that the person rescued is lawfully in the custody of such private person. The form in old English law-books is *rescous*.

Rescue Ship. Vessel employed in the Second Great War to rescue survivors from ships sunk in convoy. Convoy organization prevented ordinary vessels stopping to pick up survivors. The rescue ships were cargo boats equipped with hospital and operating theatre, and were manned by merchant seamen and R.N.V.R. doctors and medical orderlies. The rescue ship always sailed behind the convoy.

Research. Literally, a careful examination of facts. In this sense it is carried out by scientists, historians, and other scholars, and universities give research scholarships and fellowships. The great impetus given to research during the Second Great War left its mark on a number of U.K. govt. bodies. The Dept. of Scientific and Industrial Research (*q.v.*) has many

sections, as has the Medical Research Council (*q.v.*); while "operational" research, a branch of statistics (*q.v.*), was applied to marketing, advertising, etc.

Resedaceae. Small family of herbs, natives of Europe, W. Asia, and Africa. They have alternate leaves, and small flowers in racemes. The fruit is a leathery capsule open at the top, containing numerous kidney-shaped seeds. The typical genus *Reseda* includes the garden annual, mignonette (*R. odorata*), with fragrant flowers, native of N. Africa. Dyer's-weed or weld (*R. luteola*), growing in Europe, W. Asia, and N. Africa, yields a yellow dye.

Reservation of the Sacrament. Act of retaining unconsumed a portion of the consecrated elements at the Eucharist for future use. The earliest reference to the practice is found in Justin Martyr (A.D. 150), who tells us that the deacons reserved "some of the Eucharistic bread and wine" for the use of members of the church who were not present at the communion service itself. Tertullian encouraged the custom, especially in cases where any reason existed (*e.g.* the necessity of fasting on certain days) for not partaking of the elements at the actual service.

The object of the reservation was to provide (1) for the needs of the sick, since in the absence of any order for private communion in early times they would otherwise have been deprived of the Sacrament; (2) for those who lived in isolated districts, where, owing to the absence of a regular priest, the Eucharist was infrequently observed; (3) for those who were prevented by persecution or other lawful cause from attending the Eucharist itself.

The council of Saragossa in 380 declared that "whosoever does not consume the Holy Eucharist given to him in church" is anathema. This prohibition, however, seems only to have referred to private individuals, and the custom of the clergy to reserve the Sacrament for the sick, and for use in sudden emergencies, seems to have been universal. At the Reformation, Protestantism for the most part abandoned the practice. Article XXVIII of the Church of England declares that "The Sacrament of the Lord's Supper was not by Christ's ordinance reserved, carried about, lifted up, or worshipped." Attempts have been made to revive the custom, but the court of the archbishops refused its sanction in 1899 by decreeing that "the

Church of England does not allow reservation in any form." The subject was again raised during the discussions on Prayer Book revision in 1927-28 and the fact that the Sacrament was reserved in some "high" churches caused considerable controversy in the 1930s and early 1940s. See Eucharist.

Reserve (Lat. *re*, back; *servare*, to keep). Term used in a military sense for troops kept back during an action for reinforcements or to use in emergency. It is usual for the commanders of units, brigades, divisions, etc., to keep local reserves, while there is also a general reserve under the direct orders of the commander-in-chief. In the Second Great War a strategic reserve was maintained in the U.K. for use on any front requiring reinforcement. Reserve is also used for the sailors, soldiers, and airmen who have passed through the ranks, but are liable to be called upon for active service in time of war. These men are called reservists. The strength of a fighting service may therefore be computed not so much by its serving personnel as by its reserves.

The British and most other leading navies maintain a reserve fleet, composed of over-age and unmanned vessels which can be brought back into service in the event of emergency. After the Second Great War, ships of the British and U.S. reserve fleet were kept fully stored and armed, the guns and other equipment being covered with protective cocoons of plastic material. This enables vessels from the reserve to be commissioned within a few hours, whereas those laid up on the basis previously existing frequently required some months of work before they were serviceable. In 1948, the British reserve fleet was actually stronger than the active fleet, many of its units being new vessels built during the Second Great War and completed after hostilities. See Army, British; Army Reserve; Landsturm; Landwehr; Royal Naval Reserve.

IN COMMERCE. The reserve is a term used by accountants to denote (a) charges against gross profits made in the books of account for possible losses or expenses (e.g. bad debts, unsettled claims, etc.) and for undemanded or unpaid expenses (e.g. income tax or rates, etc.); and (b) allocations in the books of net profits to such purposes as superannuation, development, rebuilding, dividend equalisation, etc., or for writing off intangible assets (e.g. goodwill), or unsaleable

items (e.g. preliminary expenses), or for such objects as the redemption of debentures. The term reserve fund is sometimes used instead of reserve, but it is strictly applicable only when an amount of cash equal to the reserve is invested outside the business to furnish the necessary amount to finance the particular purpose indicated by the reserve; e.g., the redemption of debentures or the renewal of a lease.

Reserved Occupation. Term used in the Second Great War to describe men and women whose civilian occupations were of national importance and excused them compulsory service in the armed forces. Certain workers in reserved occupations were not permitted to volunteer for active service above specified age groups. As the war proceeded and the shortage of military manpower became acute, workers in many occupations became de-reserved and liable for military service. At the beginning of the war, there were some 5,000 reserved occupations, but by 1945 these had been reduced to a few hundreds. Earlier reserved occupations were as diverse as dog breeders and market gardeners. The reserving and de-reserving of occupations was the responsibility of the ministry of Labour and National Service.

Reservoir (late Lat. *reservatorium*). Construction for the storage of water. Reservoirs are of three kinds: impounding reservoirs, formed by damming the course of a stream and creating a lake, or increasing the size of one already existing; storage reservoirs, into which unfiltered water is pumped, or conveyed by an aqueduct, to deposit suspended

matter; and service reservoirs, for filtered water. The last are small, covered in, and situated at a sufficient height above the area served to give a good pressure in the mains taking water from them.

Impounding reservoirs, used either for irrigation or town supply purposes, are designed to collect a large part of the surface water from an extensive catchment area, and are often of enormous capacity. The Nile and the Roosevelt (U.S.A.) dams impound 450,000 million gallons each; the Marikanave dam (in India), 245,000 million; the Shoshone and the Olive Bridge dams (U.S.A.), 150,000 and 127,000 million respectively.

Most storage reservoirs are formed by damming a valley or depression, but others are wholly artificial, formed by the building of embankments round. One of the largest of this type is the Queen Mary reservoir, nr. Littleton, of the Metropolitan Water Board, London, which has a capacity of 6,750 million gallons. The bank is 4 m. in circumference, and the water area 723 acres. The containing embankments have core walls of puddled clay carried down to an impermeable stratum, and are constructed of material excavated from the area enclosed. The engineer balances the excavation against the embankment, removing only sufficient material for his purpose, while shaping the bed to throw all the water towards the outlet. Provided that the bed be self-draining, it need not be flat.

Service reservoirs for towns are lined with concrete or masonry and, in most cases, covered in to protect the water, which has been purified in filter beds, from contamination. The largest covered

Reservoir. Queen Mary artificial storage reservoir near Littleton, Middlesex, belonging to the Metropolitan Water Board

Reservoir. Diagrams of the Chingford reservoir which helps to supply London with water, showing how the river Lea was diverted, and the system of pumps which raises the water from the river level to that of the reservoir

reservoir in England is that at Honor Oak, in S.E. London, which has an area of ten acres and a maximum depth of 34 ft. The sides are retaining walls, backed by puddled clay. The whole of the bottom is covered by inverted arches of concrete, crossing one

another at right angles. At the points of intersection rise brick piers, which carry continuous brickwork arches running N. and S. and coated outside with a thick layer of cement. Above the cement is the clay and top soil originally taken from the site. At the point

of intersection of two walls, which divide the reservoir into four parts, are the valves by which water is admitted to and drawn off from each section independently.

One of the important factors to be considered in the construction of a reservoir is the maintenance

of a sufficient supply of water during periods of drought. This particularly applies to reservoirs which depend entirely upon the rainfall in a certain catchment area, and calculations are usually made on the assumption that there will be three consecutive dry years, when the combined rainfall does not exceed four-fifths of the average. The yield of the reservoir also depends on the area of the catchment, and the geological and physical characteristics of the neighbourhood. See Dam; Hydraulics; Water Supply, etc.

Reservoir Rock. In geology, a rock formation which contains water, natural gas, or crude oil in pores, cracks, fissures, etc. A reservoir rock must be extremely permeable. The most typical reservoir rocks are sediments—limestones, gravels, sands, and sandstones. Normally the permeability of fine-grained sediments, such as shale, is too low for them to be good reservoirs, but occasionally bedding planes, joint planes, etc., are sufficiently well developed and open to promote fluid flow. Crystalline rocks can act as reservoir rocks if joints and similar openings are large enough.

Resht or Rasht. Town of Persia. The capital of the province of Gilan, it is about 150 m. N. of Teheran, with which it is connected by a fair caravan road. Silks are manufactured, and cattle, sheep, tobacco, rice, and fruit exported. It was occupied by the British in 1918 and by the Bolsheviks in 1920. Pop. 122,000.

Residence (Lat. *residere*, to sit down). Dwelling-house. In ecclesiastical law, residence is the condition on which an incumbent holds his benefice. In England it is the custom for one canon to be in residence at each cathedral.

Resident. Diplomatic official appointed to the capital of a state bound by certain obligations to the country to which he belongs. The rulers of such states have often been guided in international (and sometimes also in domestic) affairs by the advice of the resident. There were formerly British residents at the courts of the principal Indian princes, and Sir Evelyn Baring (Lord Cromer) at one time practically administered Egypt, though officially he was only H.M. resident and consul-general.

Residual Deposits. In geology, materials left after the underlying rock has been decomposed by weathering. They include soils, terra rossa, bauxite, and laterite (q.v.).

Residual Rays or **RESTRALLEN.** Radiation remaining after rays from a continuous source are reflected a number of times from the faces of crystals of the substance under investigation. This pronounced reflection of certain wavelengths is due to the strong forced vibrations set up when the frequency of the incident electromagnetic waves is the same as a natural frequency of vibration of the charged ions of the crystal. There are two main groups observed, both in the infra-red, that with a longer wavelength corresponding to vibrations of the positive and negative ions of the crystal lattice with respect to one another. The short wavelength group result from vibrations within the polyatomic ions.

Residue (Lat. *residere*, to remain behind). That which is left, the remainder. The word is used in connexion with wills and bequests. In English law, a residuary legatee is the person to whom a testator bequeaths the rest or residue of his personal estate after satisfying particular bequests. A residuary devisee is the person to whom a testator gives the rest of his real property, after satisfying all the claims of particular, or specific, devisees, and after satisfying all other claims on his real estate. See Will.

Resilience. Colloquially, the power of a body to recover after strain. In engineering, the work done in producing stress in a body within its elastic limits, or the work done by the body in regaining its original form. Thus, if 13 tons per sq. in. be the elastic limit of stress for a steel bar, and if the bar be subjected to any stress below 13 tons per sq. in., it will be temporarily deformed. It will, however, elastically recover its original shape and size when freed from stress, but if the elastic limit of stress be exceeded, the bar will be permanently deformed. The modulus of resilience of a material, or the maximum amount of strain energy per unit volume at the elastic limit, is a measure of its capacity for resisting shocks or blows.

Resin. Name given to viscous exudations from the bark of certain trees, applied also to synthetic preparations of similar nature. Natural resins which contain varying quantities of essential oil, usually harden in time, partly as a result of chemical change, and partly owing to evaporation of the essential oil.

Some, however, owing to the nature of the essential oil, remain pasty (elemi) or even liquid (balsam, e.g. Copaiba and Peruvian). The characteristic ingredients of the resins are an inert substance, resene, of which the chemical constitution is little understood, and complicated resin acids which are related to the terpenes, and thus to the essential oil with which they are associated. They are distinct from the gums, which are related to the starches (carbohydrates). While gums are soluble in water and insoluble in organic solvents, resins are insoluble in water, and at least partially soluble in organic solvents. When heated resins melt and burn with a smoky flame giving an aromatic smell, whilst the gums char and give an odour of burnt sugar. In the trade, however, resins are called gums and the trader a "gum merchant."

Much of the resin of commerce comes from tropical forests where it is collected by the natives, either from the trees or, in the form of fossil resins, from the soil in which it has lain buried, often for centuries. Sometimes the trees are intentionally wounded (tapped) and, notably in the case of the rosin and turpentine industry, the trees are grown, tapped, and eventually cut down according to a carefully designed scheme. The principal resins are:

(1) *Rosin* (Colophony). This is obtained from many species of pine. The exudation also contains about 20 p.c. of an essential oil—the turpentine of commerce.

Rosin contains over 90 p.c. of resin acids which can be combined with alkali (e.g. soda) to form soap. Combined with metallic oxides, such as litharge, it yields driers for paints and varnishes. Rosin with glycerine forms estergum, a substance which possesses most of the useful properties of rosin without the acidity that causes "livering."

(2) *Damar* (Malay, torch). Name for a series of resins produced by many species of trees in Indonesia; they are soluble in turpentine and in coal tar naphtha and other organic solvents. They yield clear, pale, glossy varnishes, sometimes called crystal varnishes, formerly much used for coating paper. The films, however, lack durability and tend to remain sticky to the touch, and damar varnish has been largely replaced by synthetic products.

(3) *Copals* (Mex. *copalli*, incense). The name applied to a group of resins which are import-

ant ingredients of oil varnishes. They contain much less resin acid than does rosin, and are soluble in linseed oil only when partially decomposed by heat. Their solubility and hardness vary widely. The trees producing them are very long lived, some probably 300 or 400 years old. Luzon in the Philippines was formerly an important producer, and the softer resins are still called Manila copals.

The most important varieties are generally known by the name of the port of shipment, e.g. Pontianak (Borneo), a very much valued resin, and Zambas (Celebes).

In the Belgian Congo the collecting, cleaning, and grading of copal resins has been highly developed. An important property of the Congo resin is that, like rosin, it can be combined with glycerine, the product, Congo-ester, being a resin of low acidity which can be readily incorporated in oil to give a series of varnishes and paint media of very high gloss and durability.

Resins of minor industrial importance include sandarac and mastic. Sandarac is obtained from certain species of Coniferae (*Tetraclinis*). Formerly used in making clear, hard varnishes for labels, cardboard, leather, etc., it has been to a large extent replaced by synthetic lacquers.

Mastic is produced by a tree which grows in S. Europe and N. Africa and closely resembles sandarac. The bulk still comes from the island of Chios where it has been collected since very early times. It was referred to by Pliny (A.D. 70). It is used as a protective varnish for oil paintings.

Dragons' Blood

Various other resins are, or have been, used in medicine and as incense. Gum benzoin, which comes from Siam and Sumatra, is a typical incense resin. Dragons' blood is the name applied to several resins producing a red colour. Formerly much prized, dragons' blood was used by the great Italian violin makers of the 18th cent. The resin then used probably came from W. Asia and the island of Sokotra; the Arabs called it *dam-el-akhwain* and used it in medicine.

The elemies are soft, pasty resins which do not harden, exuded by many species of tropical plants. They have been used since very early times in medicine, but have been to a large extent replaced by synthetic products.

SYNTHETIC RESINS. These are synthetic products which fulfil

functions similar to those of the natural resins, namely the production of decorative and protective coatings. They form part of the group known as plastics. The product of the reaction between phenol and formaldehyde, introduced in 1908, could, while soluble, be applied as a varnish coating and then converted by baking to an insoluble and infusible form, thus acting as a stoving varnish. Later, oil soluble resins were made by including resin in the reaction. A further development was the use of higher phenols and aldehydes to give harder and more durable products. Glyptal resins made from phthalic anhydride and glycerine followed a similar line of development; and the alkyd resins are even more important than the phenolic type in the varnish and coating industries.

Urea with Formaldehyde Group

Another important group is that based on the condensation of urea with formaldehyde, which yields colourless resins. These are used to some extent in the production of synthetic finishes, but their main use is in mouldings where colour is important, particularly in synthetic cups, plates, etc. The vinyl, styrene, and methyl-methacrylate resins are transparent, and have optical properties which make them a substitute for glass; some of them are also used in the production of special coatings. The resins produced by polymerising coumarone—a constituent of coal tar naphtha—are used in coats where chemical inertness, particularly to alkalis, is important.

Synthetic finishes have the advantages that (1) they are consistent in quality; (2) they can be modified at will to produce specified properties; (3) they give finishes of great hardness, durability, and gloss retention combined with rapid drying.

MODIFIED NATURAL RESINS.

The competition of synthetic resins has led to the use of resin as a raw material for the production of an intermediate product which can be standardised. A typical method is to combine glycerine partly with resin and partly with an acid, such as phthalic acid, thus producing a combination of synthetic resins of the glyptal type and an ester gum. Oils and phenol-formaldehyde condensations can also be introduced by suitable technique.

Lac resin, the origin of which is described under Lac, is in many respects unique. It is cheaper than its potential rivals, and for

some purposes has, as yet, no completely satisfactory rival.

Dissolved in alcohol, lac resin forms the basis of a series of spirit varnishes and of french polish. On heating, it first becomes plastic and then permanently hard, infusible, and insoluble. It can, therefore, be used in making moulded articles, e.g. gramophone records, for which it has no equal on account of the fidelity with which it takes the impression, and the hardness and smooth finish of the surface. Before the Second Great War the record industry took more than 50 p.c. of the output. Lac resin also has excellent electrical properties. Lac used in aqueous alkaline solution (e.g. borax or soda) gives films which are waterproof when dry; such solutions form the basis of many waterproof inks and varnishes. See Glyptal Resins; Lacquer; Plastics; Turpentine; Varnish, etc.

T. Hedley Barry

Resina. Town of Italy, in the prov. of Naples. It stands on the Gulf of Naples, adjoining Portici (q.v.) at the S.W. base of Mt. Vesuvius, and is built on the lava-streams covering Herculaneum (q.v.). The starting place of the electric rly. ascending the volcano, it has trade in the famous Lacrima Christi wine made from the vines grown on its slopes.

Resistance. In electricity, measure of the extent to which a conductor resists or opposes the passage of an electric current. It may be simply visualised as electrical friction. Just as the friction of water flowing in a pipe causes a loss of "head," or pressure, so the resistance of a conductor causes a drop in voltage. The practical unit of resistance is the ohm, the resistance of a circuit which permits a current of one ampere to flow when one volt is applied to it. The power lost in a resistance appears as heat, and the electric heater is an example of resistance deliberately introduced to obtain heat.

The resistance of a conductor depends upon the length (the longer the conductor the greater the resistance); the cross-sectional area (the larger a conductor is the smaller will its resistance be); and the material of which it is made. Iron, for example, has nearly six times the resistance of copper. Silver is the best conductor; copper, the next best, is almost universally used, although aluminium (having about 62 p.c. of the conductivity of copper) is also used, particularly for over-

head conductors where lightness is an asset.

Resistance is also used to a considerable extent in electrical control. In spite of the waste of power, it is often the most convenient method of adjusting the current flow. Such resistances take the form of spirals of wire, cast-iron grids, or blocks of carbon. In order to prevent confusion between the abstract quantity "resistance" and an actual piece of apparatus, it is nowadays usual to refer to a piece of apparatus having a certain value of resistance as a *resistor*, and to a variable resistance as a *rheostat* (*q.v.*). Most substances show an increase of resistance with temp., but carbon decreases. All metals have very low resistance at low temps. See *Electricity*; *Electric Power*; *Grid*.

Resistance Movement. Name given during the Second Great War to the groups of patriots in countries overrun by Germany who organized resistance to the occupying force. Their activities included the production and distribution of clandestine papers; sheltering R.A.F. personnel who had escaped from aeroplanes brought down over the Continent, and passing such fugitives back to the U.K.; sabotage in factories; hiding young fellow-countrymen called up for labour service in Germany; collecting and forwarding through British agents information about German military dispositions, inventions, and industrial programmes; and, after the Allied invasion of Europe, blowing up bridges, rly. lines, etc., and active warfare as underground armies. Thousands of French, Belgian, Netherlands, Polish, Greek, Yugoslav, Norwegian, and Danish men and women enrolled in resistance organizations; and Italians developed a strong movement in the N. after Italy became a co-belligerent of the Allies in 1943. Hundreds of resistance workers were caught and sent to concentration camps; many were tortured, shot, or hanged. See under *Belgium*; *Denmark*; *France*; *Greece*; *Italy*; *Maquis*; *Netherlands*; *Norway*; *Poland*; *Warsaw*; *Yugoslavia*.

Resistencia. City of Argentina and capital of the Chaco territory. It stands on the Parana river, but its port is at Barranqueras, 4 m. E. It is connected to Santa Fé by rly., and served by river steamers. It is a centre for trading in cattle, cotton, skins, and timber. Pop. 50,000.

Res judicata (Lat., - thing judged). Term in general use in law. It means a dispute or matter which has been finally and decisively adjudicated upon by a competent court, so that it cannot be reopened. It is a matter of high legal policy that when once a question has been tried and finished it shall not be reopened; otherwise there would be no end to litigation. The plea of *res judicata* is conclusive; but it applies only when the person who brings a fresh suit is really trying to rake up the identical matter that was determined in the previous case. *Res Judicatae* is the title of a book of essays by Augustine Birrell (*q.v.*).

Resolution. Literally, something that is decided upon, and therefore meaning determination and steadiness. In a narrower, but derived sense, the word is used for a proposal put in definite terms before a public meeting or a committee. The house of commons sometimes declares its will in resolutions, but these are not laws until embodied in an Act of parliament. See *Chairman*.

Resolution. In music, the necessary progression of a discord to an adjoining note so as to complete the grammatical sense. Here F is the discord which resolves upon E. The term is also applied to the progression of the chord containing the discord.

Resolution of Forces. Process in theoretical physics. Two forces OA and OB acting at a point O may be represented, if drawn to scale, by two sides of a parallelogram, and the direction in which a particle moves will be given by the diagonal OC of the parallelogram. Conversely a force applied in the direction OC may be resolved into two forces given in magnitude and direction by OA and OB. This latter process is known as the resolution of forces. The resolved part, in any direction, of a force F is given by $F \cos \theta$ where θ is the angle between the force and the given direction.

Resonance (Lat. *resonare*, to sound back). Production of vibrations in a body by the action of a periodic force which has the same period of vibration as the natural period of the body. It occurs frequently in sound. If, for example, two tuning forks of the same pitch are held near each other, and one is sounded, the sound waves sent out

by it will strike the second fork, and cause the latter to vibrate in unison.

Resonators are commonly used to increase the apparent intensity of the sound of the particular pitch to which they respond, but the sound dies away more rapidly. The sound of a tuning fork may be increased by a resonator in the form of a hollow box, or of a pipe closed at one end, open at the other, the air column of which has a natural period of vibration equal to that of the tuning fork—that is, its length is equal to one-fourth of the wavelength of the note given by the fork. If now the sounding fork is held near the open end of the pipe, the column of air in the pipe, being a natural resonator to the fork, will be set in vibration.

If the open end of the pipe is fairly large, the vibrations of the column of air will set the external air in motion more powerfully than the fork did by itself, and the intensity of the sound will be much increased. The vibration of such columns of air in pipes is made use of in many musical instruments. The sounding board of a piano or the body of a violin are also examples of resonators, increasing the natural volume of sound. Electric resonance occurs when an electrical circuit has a natural period equal or nearly equal to the period of the source of impulses or alternating electromotive force. See *Radio*; *Sound Reproduction* and *Amplification*.

Resorcinol OR **RESORCIN** ($C_6H_4O_2$). White crystalline substance obtained by the interaction of fused sodium hydroxide and sodium metabenzene-disulphonate, or it may be obtained by fusing certain resins with caustic potash, or by distillation of Brazil wood extract. Resorcinol appears as colourless crystals soluble in water and alcohol. From it are prepared a number of dyes. It is used in medicine occasionally in certain skin affections, as a lotion or with glycerine. Hexylresorcinol is used as an antiseptic.

Respighi, OTTORINO (1879–1936). Italian composer. Born at Bologna, July 9, 1879, he studied composition with Rimsky-Korsakov in St. Petersburg (Leningrad) and with Bruch in Berlin. He became famous for an arrangement of pieces by Rossini which Diaghilev presented in 1919 as *La Boutique Fantasque*. The operas *Belfagor*, 1923, and *La Fiamma*, 1934, were well known abroad, and symphonic pictures of Rome

were popular in England, *e.g.* Le Fontane di Roma, 1916. Music for the ballet, *The Birds*, is by Respighi. He became professor of composition at the royal school of S. Cecilia, Rome, 1913, succeeding as principal in 1924. He died April 18, 1936.

Respiration. Process which leads to the liberation of energy within the body of a living organism. The most widely known form of respiration involves the intake of oxygen and the giving out of carbon dioxide, an exchange of gases which in higher animals is usually spoken of as external

Respiration. Diagram illustrating the movements of the diaphragm during respiration

respiration, in contrast to internal (or tissue) respiration. In this latter process energy is actually released within the cells. In higher animals the lungs, chief organs of external respiration, are inflated when downward contraction of the diaphragm (abdominal respiration) and upward movement of the ribs (thoracic respiration) cause enlargement of the chest, to be deflated by reverse changes. Marine animals breathe by means of gills. In most higher plants gaseous exchange occurs between the atmosphere and the intercellular spaces, mainly through the stomata of leaves and young stems and the lenticels of woody stems and roots.

In man the organs through which respiration is effected are the air passages, composed of the larynx, trachea and bronchi, and the lungs, the structure of each of which is described under its appropriate heading. The movements of the thorax are caused by certain muscles which, by contracting, bring about an increase in the volume of the chest cavity. The lungs expand with this increase of volume, and air is drawn into them through the air passages. This is the process of inspiration and is a muscular act. The respiratory muscles now relax, and the elastic recoil of the chest and lungs expels the air. This is expiration, and in ordinary quiet breathing entails no muscular effort.

The ordinary muscles of respiration are: (1) the diaphragm, which is dome-shaped and forms the floor of the thoracic cavity. On contraction the diaphragm is drawn downwards, and the vertical diameter of the chest is increased. (2) The intercostals, or muscles between the ribs. The upper ribs being fixed by the muscles of the neck, the contraction of the intercostals raises the lower ribs and enlarges the lateral and anterior-posterior diameters of the thorax.

In extraordinary or forced inspiration, such as occurs when there is obstruction to the entry of the air, or in coughing, additional muscles come into play, particularly the sterno-mastoid, serratus magnus, pectoral, and trapezius muscles. In forced expiration the abdominal muscles also contract and, by pressing on the viscera, push up the diaphragm and thus help to expel the air from the lungs. In men, the respiratory movements are most marked in the lower part of the chest and the abdomen (inferior costal type). In women, the movements in the upper part of the chest are more marked, and those of the lower part of the chest less obvious (superior costal type). The lungs are not completely emptied at the end of each expiration.

The following terms are used for the quantity of air breathed or in the lungs: Tidal air is the amount ordinarily breathed in and out, and in a healthy adult man is about 30 cu. ins. Complementary air is the amount in addition to the tidal air which can be drawn into the lungs by the deepest forced inspiration, and is on the average 100 cu. ins. Reserve or supplemental air is the amount over and above the tidal air which can be expelled by deep forcible expiration, and is about 100 cu. ins. Residual air is the amount which still remains in the lungs after the most violent expiratory efforts, and amounts usually to about 100 cu. ins.

Rate of Respiration

The effect of continuous muscular effort, as in running a race, is greatly to increase the amount of air inhaled and exhaled at each respiration, and the establishment of this process is popularly known as "getting the second wind." The rate of respiration in a healthy adult is from 14 to 17 per minute. It is increased by exercise, febrile conditions, and certain diseases of the lungs. The total quantity of air inhaled and exhaled during 24 hours by a healthy adult varies from 400,000 to 650,000 cu. ins.

Regulation of the rhythmic movements of respiration is controlled by a respiratory centre in the brain, by the vagus nerves, and by the chemical condition of the blood.

Cheyne-Stokes respiration (*q.v.*) is a condition in which the breathing gradually becomes deeper for a brief period, and then shallower until it almost ceases.

Artificial respiration is explained in a separate article.

Respirator. Device to enable breathing to be maintained in an atmosphere poisonous or otherwise harmful; to provide breathable air where no atmosphere exists; or to enable medicated vapours to be inhaled.

Industrial respirators are of various types, but basically they consist of a mask covering the mouth and nostrils and fitted with a filter. For breathing in a dust-laden atmosphere the air is filtered through fine gauze, and if steel particles are present the gauze is magnetised. Respirators for use in atmospheres containing carbon monoxide are self-generative. Compressed air and oxygen, stored in cylinders strapped to the wearer, are drawn through a valve to lower the pressure, and then inhaled. The exhaled air is blown through a valve into a chamber where it is filtered by soda lime or other absorbent and returned to the breathing circuit. Thus the same air is breathed several times over. The self-generative respirator is used by firemen working in smoke, mine rescue parties, and divers in free diving-suits.

Respirators which supply oxygen are used by the crews of high-flying aircraft. In this respirator the exhaled air escapes to the atmosphere and the respirator ceases to function after the oxygen cylinder is exhausted. A similar respirator is worn by divers in non-self-contained suits. Air from the surface is forced down a tube and through a valve into the helmet, the exhaled air escaping through an outlet valve.

Military respirators were introduced in 1915 following the first use of chlorine gas by the Germans that year. They consisted of a flannel bag to cover the wearer's head, the ends being tucked into the neck of the tunic. The bag, which was provided with a mica window, was impregnated with sodium carbonate, which combines with chlorine and purifies the air passing through it. Later, when the Germans commenced using phosgene, the flannel was impreg-

nated with sodium thiosulphate and sodium phenate, and fitted with a valve through which the exhaled air was released to the atmosphere.

The advent of gas shells, which released high concentrations of a wider range of toxic materials, led to the introduction of the box respirator. This consists of a close fitting mask connected by a flexible tube to a box containing alternate layers of active absorbent charcoal and pumice impregnated with sodium carbonate and hexamethylenetetramine. As each new war gas was developed filters capable of rendering the respirator resistant were added.

Shortly before the Second Great War, respirators were issued to the civilian population of Great Britain as protection against gas. The civilian respirator was

basically the same as the military type, except that the filter was incorporated with the mask; when it was thought in 1940 that the enemy might use arsine, civilian respirators were fitted with a special filter. Children's respirators were made in the shape of animal heads, and a hood respirator was introduced for infants. Civilian respirators, unlike the military type, did not permit the wearer to engage in active work. Although poison gas was not used in the Second Great War, a new military respirator was issued to the British forces in 1944; this incorporated the filter with the mask.

Military respirators are not made to be resistant to coal gas.

There are a number of respirators used for medical purposes, particularly for inhaling vapours in the treatment of catarrh and asthma. The iron lung (q.v.) is a form of hood respirator used to induce normal breathing artificially. See Chemical Warfare.

Responsibility. Term used in English law, in contracts and statutes. In leases it is frequently provided that the lease shall not be assigned except to a respectable and responsible person. The word here means a person who has the necessary means to pay the rent and satisfy the other lessees' obligations. Carriers of goods sometimes stipulate that they will not be responsible for certain articles (e.g. livestock and perishable goods). Such stipulation covers both loss of and damage to the goods.

Rest. In music, sign to indi-

cate silence. Rests are of different values corresponding to the various notes (see illus. above). They may be dotted, but never twice-dotted. Silence for a whole bar, whatever the value, is usually shown by a semibreve rest.

The word is used by the Bank of England and other banks for their reserves, while another meaning is for that part of a lathe which supports the cutting tool.

Rest-and-be-Thankful.

Name given to the summit of a steep pass in Argyllshire, Scotland, the words being inscribed on a stone seat. The road running W. from Arrochar through the desolate Glen Croe ascends by zigzags some 860 ft. above sea level, giving a magnificent panorama from the top. Wordsworth wrote a poem on the place.

Restaurant (Fr. *restaurer*, to restore). An establishment where meals are provided. Popularly, there is now little distinction between a restaurant and a café, but the term restaurant was originally applied only to an establishment making a speciality of some particular dish, as distinct from the café, inn, or eating house which offered a general bill of fare.

The first restaurant to be called such was established in 1765 in the Rue des Poulies, Paris, by a café-keeper named Boulanger. His speciality was soup and entrées, and he kept a good cellar. By lavishly decorating his premises, providing a clean table-cloth for each diner, and charging high prices, he was able to restrict his clientele to a circle of socially eminent persons.

Boulanger was followed by a number of imitators, but the restaurant era did not begin in earnest until the French Revolu-

Respirator. Self-regenerative oxygen-breathing apparatus. A, nose-clip; B, mouthpiece; C, exhalation tube; D, exhalation valve; E, relief valve; F, breathing bag; G, absorbent; H, oxygen bottle; I, bottle closing valve; J, pressure gauge valve; K, by-pass valve; L, reducing valve; M, flexible tube; N, pressure gauge; O, oxygen supply tube; P, inhalation valve; Q, inhalation tube; R, cooler. Arrows indicate direction of air flow. The wearer exhales through the valve D, the air passing down one partition of the breathing bag and through the absorbent; it then passes up the other partition to the reducing valve L, where it is mixed with fresh oxygen from the bottle H. The pressure gauge indicates the quantity of oxygen in the cylinder and duration of supply. The by-pass valve K is for use in the event of the reducing valve failing, and enables the wearer to breathe directly from the oxygen bottle

Courtesy Siebe, Gorman

tion, when many of the chefs from the homes of the aristocracy lost their positions and opened restaurants. Among these restaurants were that of Legarocque in the Jardin des Tuileries, where Marat and Couthon hatched their plots; the Café Royal, established in 1808; Beauvilliers Restaurant, founded by the ex-chef to the Prince de Condé; and Robart's, opened by the ex-chef to a farmer-general of taxes. Later, and equally famous, Paris restaurants still existing are the Maison Dorée, Restaurant Peter's, Café Riche, Champeaux Philippe, Café Durand, and La Tour d'Argent. These base their charges on the à la carte system, payment being according to the actual meal chosen.

One of the first restaurants opened in Great Britain was at Whiteley's, London, in 1873, mainly for the benefit of the store's customers. Many of the best-known London restaurants were opened in the last two decades of the 19th century. Among the most notable now existing are Frascati's, Simpson's, the Café Royal, Rule's, Oddenino's, and the Holborn. Many of the larger hotels also began to cater for non-residents, and for many people with money to spare a restaurant dinner became the normal way of starting an evening's entertainment, and a restaurant supper the recognized way of finishing it. In time, many of the French and Italian waiters employed by the large restaurants opened establishments of their own, chiefly in Soho, where they provided good food and wine tastefully served at prices which were not exceptionally high.

Although most good English restaurants follow the French à la carte system, a number introduced a table d'hôte service, which charges a fixed price for a specified meal, excluding drinks. In England, the distinction between café and restaurant has become increasingly difficult to define, but in general the café serves snacks as well as full meals and is not licensed for the sale of intoxicants.

During the Second Great War, and for some years afterwards, food control and rationing necessitated restrictions on the variety and amount of food consumed in restaurants. Each diner was restricted to three courses; bread or rolls counted as one course, 1946-48. The maximum price of a restaurant meal was fixed at 5s., but proprietors were permitted to add a cover charge, the maximum

for this being 7s. 6d., to meet the cost of orchestra and other amenities, and a surcharge. No limit was fixed to the amount spent on drinks. See Café.

Rest Harrow (*Ononis spinosa*) OR WILD LIQUORICE. Shrubby dwarf perennial of the family Leguminosae. It is a native of

Rest Harrow. The flower of this perennial, left, and the fruit, right. Top, the plant

Europe, W. Asia, and N. Africa. It has a creeping rootstock, above or below ground, whose rooting gives it so firm a hold that it was said to arrest the plough or harrow in its progress. The leaves are undivided or broken up into three leaflets. The flowers, similar to those of the furze, are pink with red streaks. The fruit is a small pod. In dry soils the stems become more erect and develop spines.

Restigouche. River of New Brunswick, Canada. It rises in the hills in the W. of the province, flows N.E., and then turning E. forms the boundary between Quebec and New Brunswick. It is 225 m. long, falls into Chaleur Bay, and is navigable for large vessels for about 20 m. The name, of Indian derivation, means "the river in the shape of a hand," the reason being that it has five main arms.

Restitution (Lat. *restituere*, to set up again). Act of restoring something taken away, or making good. The restitution of conjugal rights is a phrase used in English divorce law. A husband or wife whose spouse refuses to cohabit may obtain a decree for the restitution of conjugal rights, whereby the spouse is ordered to return to

cohabitation within a fixed time. If the respondent disobeys the order he or she is not punished, as was formerly the case, but disobedience constitutes desertion. See Divorce.

Restoration, THE. In English and Scottish history this term means almost always the restoration of Charles II in 1660. In France it refers to the restoration of the Bourbons in 1814. The so-called Restoration period in England embraces the years after 1660 when, in morals and literature, there was a reaction from the austerity of the Puritan rule, which showed itself in licence and even indecency. A group of playwrights who came into prominence at this time, Congreve and Wycherley being the best known, are usually called the Restoration dramatists.

The restoration of Charles II was the work, not of Monk, but of events. After his romantic escape from Worcester, Charles had been an exile from England. In all three countries, however, especially in Scotland and Ireland, he had many supporters, and the harshness of Cromwell's rule added to their number. Risings, notably that of Glencairn in Scotland and Penruddocke in England, broke out in his favour; earlier Montrose had campaigned brilliantly for him. But as long as Cromwell's military genius and the trained valour of his Ironsides were available, all hope of a Stuart restoration seemed vain.

With Cromwell's death the position was wholly changed. His son Richard proved a weakling, and soon retired into private life. In 1659 the royalists arranged a rising, and, to take advantage of its anticipated success, Charles moved from Brussels to Calais. But the effort failed; concerted action was wholly lacking, and only in Cheshire was the movement at all serious. The king's friends were not successful until early in 1660, when Monk (see Albemarle) had been some weeks in London, and plans for a stable government had failed. By Sir John Grenville, Monk sent a verbal message to Charles, advising him to promise oblivion for past offences and religious toleration; also to move to Breda (*q.v.*), and there await events.

The declaration of Breda, drawn up on these lines, followed, and a convention parliament met. To this Charles sent a letter which was read on May 1. The members professed their loyalty to their

king, as they now called him, and declared that their lawful and ancient government was by king, lords, and commons. On May 8, Charles was proclaimed king in London; on the 16th he received at The Hague a deputation of lords and commons, asking him to return, and on the 23rd he went on board the *Naseby*, the flagship of the fleet sent for him. Amid great rejoicing, he landed at Dover, held a council at Canterbury, and on the 29th, his birthday, he travelled from Rochester to London, where the people welcomed him with wild excitement. Scotland followed the example of England, and a parliament in Edinburgh restored the monarchy. Ireland was bound by the act of the English parliament. See Charles II; England; History.

Restoration. In architecture, the process of repairing or reconstructing a building so that it shall retain or regain its original character. Restoration is almost wholly a modern art; prior to the 19th century a building that had become seriously dilapidated was either patched up in accordance with the utilitarian needs and fashion of the day, or replaced by another of a totally different kind. The educational or aesthetic value of a medieval or Renaissance structure was never considered. In the 18th century, when the decadence of the Renaissance style had reached its limit, a mild interest was awakened in the earlier forms of building, and in Great Britain the dilettante headed a kind of Gothic revival. Wars, however, and the industrial revolution deferred the question of restoration till early in the 19th century.

A movement for the better understanding of the principles of medieval architecture was then set on foot by the Camden Society, while in 1840 the newly-formed Ecclesiological Society turned its attention to explaining the usages of the pre-Reformation Church in the light of Gothic fittings and ornaments. Meanwhile Pugin (*q.v.*) had started his crusade for the resuscitation of Gothic; and restorations along this line proceeded with a rather too feverish haste. They passed finally under the control of a small band of Gothic purists who, not content to restore a church as it had been before, pulled down or mutilated those parts which did not accord with the period in which the remaining parts were built. The British Society for the Protection of Ancient Buildings, formed under Morris's influence in 1877, has since

done much to improve the character of restorations, while in France the Commission des Monuments Historiques has performed similar invaluable service.

Restorationists. Term applied in Church history to those followers of Origen who held that all sinners will ultimately be forgiven and received into God's favour after a period of purgation in the next world. This is distinct from the R.C. doctrine of purgatory. The name has been used also for an American sect of Universalists, founded about 1818 by Hosea Ballou at Boston. He taught that sin is entirely connected with the body, and that the article of death, by freeing the soul from the body, sets it free also from the consequences of sin. His followers separated from the Universalists and formed a definite sect in 1831.

Restraint (Lat. *restringere*, to draw back). Literally, the act of hindering or limiting. Restraint of marriage is a restriction attached to a bequest forbidding a devisee to marry. The law of England, we are told by ancient writers, looks on marriage with favour—no doubt as much for political as for moral reasons. A married man is more likely to be a good citizen than a single one. Therefore gifts given upon conditions restraining marriage will generally be held to be given as if such conditions had not been made. Thus, a devise of an estate to A, but if A marries then he is to lose the estate, is bad. It can, however, be expressed another way. If the gift is "I devise Blackacre to A; but upon A's marriage or death then Blackacre is to go to B," it is quite good. So it is quite lawful to bequeath an income to a woman during her widowhood; but in a gift of the same income to a widow, with a condition that she shall lose it on re-marriage the condition is bad, as being in restraint of marriage.

By the law of England an agreement in undue restraint of trade is bad, as being against public policy. By such an agreement is meant one whereby a person binds himself to exercise his trade, profession, or calling in such a way as to fetter himself unduly. And the reason why such an agreement is void is because it is to the public interest that all men shall be free to work and carry on business.

Agreements of this kind are, in the main, of two kinds: (1) When an employee, as part of his agreement of service, contracts that after his service is terminated he will not carry on the same kind of

business or enter the service of another employer in the same business within a certain area. (2) When a man sells a business and agrees that he will not carry on a competing business, generally within a certain area. In both these cases the agreement is void if it is unreasonable, i.e., if it is more than is reasonably necessary to protect the promisee. This depends on the kind of business. Thus, a grocer's assistant who agreed not to take a similar situation within 20 miles of his master's shop has probably contracted unreasonably. But a solicitor who has sold his practice with a covenant not to practise within 20 miles may have contracted reasonably.

Formerly property could be settled on a married woman with a restraint on anticipation, preventing her using the capital or future income. This was abolished in the U.K., partially 1936, entirely 1949.

Restriction of Output. The deliberate limitation of what is produced during a certain period, by workpeople, by individual businesses, by groups of businesses, or by a whole industry.

Restriction of output of all these types was a common feature of world industry during the period 1920-35. Restriction of output by employees was practised and may still be practised for the following reasons: (a) fear of unemployment, to make the work last longer—this type would disappear if full employment were maintained; (b) fear of worsening piece-work rates or increasing the severity of working conditions—those who worked to their utmost to earn as much as possible used to be called "rate-busters" in the early 20th century, before the technique of rate-fixing had been improved; (c) hostility to supervisors, the management generally, or to the notion of "making profits for shareholders." Restriction of output by those in charge of businesses may reflect (a) the desire to maintain a high level of profit through artificial scarcity; (b) the process "rationalisation," i.e. the maintenance of a profitable ratio between existing demand and the supply; (c) the need to adjust the supply to a diminished demand. The converse of restriction of output is a "policy of plenty," where the emphasis is placed not on the acceptance of existing demand but on the expansion of demand by all means possible, and the satisfaction of the expanded demand by the full utilisation of productive resources.

Resultant Tones. Acoustical phenomenon produced by the simultaneous sounding and sustaining of two loud notes. Differential tones are according to the difference of vibrations between the generators. Thus, in the case of a fifth, the relative proportions of which are 2:3, the differential tone will be equal to 1, i.e. an octave deeper than the lower generator. It is on this principle that the acoustical bass of some organ pedal stops is produced. Summational tones, on the other hand, are the result of the sum of the vibrations. Resultant tones, which are more subjective than objective, were first noticed by the violinist Tartini in 1714, who taught his pupils to apply them as a test of accurate tuning. He called them *Terzi Suoni* or Third Sounds.

Resurrection (Lat. *resurgere*, to rise again). Term specially used of rising from the dead, also applied figuratively to the revival of anything in a state of decay. Every spring witnesses a resurrection, the renewal of the life of nature, to which winter had brought death. In many religions there are myths of resurrection, the descent of a god or goddess to the realms of darkness, and the ascent again to the world of light.

The conception meets us in the O.T., first of all, in the two records of restoration of life by a prophet (1 Kings xvii, 20-24; 2 Kings iv, 32-37). It is applied figuratively to the nation's restoration from Divine judgement to Divine favour (Hosea vi, 1-3). To the hope of national restoration there attached itself the hope of individual restoration from death to life. It seemed an intolerable thought that those who died before "the day of the Lord" should have no share in its blessings, and so the belief arose that the good and godly would be raised up even from the grave (Isaiah xxvi, 19). This belief was afterwards extended to include the bad as well as the righteous (Daniel xii, 2); the one class to be consigned to eternal punishment, the other to be blessed with eternal life.

Doctrine of the Last Things

There can be little doubt that Judaism was strongly influenced by the corresponding doctrine of Zoroastrianism, in which there is a very detailed eschatology or doctrine of the last things. In the Apocryphal and Apocalyptic writings the doctrine of the Resurrection assumes a much more definite form. In some of these writings only the resurrection of the righteous is taught, in others of the wicked as well. In 2 Maccabees vii, 11, the martyr expects to

receive back the tongue and hands of which he had been deprived on earth. In Enoch v, 16, a contrast between present and future conditions is asserted; the garments of life given at the Resurrection will not grow old.

The Sadducees regarded this development as an illegitimate innovation, but the Pharisees accepted it (Acts xxiii, 8). How completely the latter expected the restoration of earthly conditions at the Resurrection is seen in the problem regarding the woman with seven husbands which the former submitted to Jesus for solution (Matt. xxii, 23-33). Jesus in His answer censured the Sadducees' rejection of the belief in the future life in communion with God; but no less did He condemn the Pharisaic literalism, and asserted a great change in the conditions of the future life. Paul no less insists on a continuity of life, but also on a contrast of its conditions, opposing to the natural the spiritual body (1 Cor. xv, 39-58).

The hope of the Resurrection is not, however, the mere survival of the soul after its escape from imprisonment in the body. In the Christian doctrine no material identity is affirmed between the body laid in the grave and the body raised, as has sometimes been assumed; that assumption is excluded by the teaching of Jesus and Paul. But what is unequivocally asserted is that the personality of which the identity is maintained will not be disembodied, but possess an organ of activity and communication, described as spiritual because adapted to spiritual uses as the natural body is not.

Second Advent

In the N.T. the Resurrection is closely connected with the Second Advent of Christ, and is expected in the immediate future. When some believers died before that much desired and eagerly expected event, Paul found it necessary to comfort the mourners with the assurance that the living at the Second Advent would have no advantage over the dead (1 Thessalonians iv, 13-18). In view of the predominance of the expectation of a speedy Advent, the N.T. is silent regarding the conditions of the intermediate state between death and the Resurrection. In the Fourth Gospel the ideas of judgement and resurrection are spiritualised, and yet the common Apostolic expectation is not abandoned. The teaching of Jesus, according to the Fourth Gospel, about the Father's house of many mansions (xiv, 1-3), has led modern Christian faith to assume,

without recognizing any departure from the prevalent teaching of the N.T., that Christ receives the believer at death, and that the glory and blessedness of heaven are at once possessed.

The divine seal on the human hope of resurrection is given in the fact of the Resurrection of Jesus (1 Cor. xv, 12-19). To conceive this fact as merely a survival of the soul of Christ is to ignore the consistent meaning of the word resurrection in the Old and the New Testament. To add the epithet spiritual does not justify such a wide departure from the usage. The N.T. teaches that Jesus was raised from the dead bodily. It is not at all necessary to assume any material identity of the body laid in the sepulchre with the body in which Christ appeared. It was with a spiritual body Jesus rose from the dead, and the relation between that and His natural body we may assume is described by Paul (1 Cor. xv, 51-52); by an act of God the one was changed into the other.

Gospel Evidence

On the belief in the Resurrection the faith of the Christian Church in Christ as Living and Reigning Saviour and Lord rests. The attempt to account for that belief apart from the fact, as in the vision hypothesis, has against it the amount and the nature of the evidence, the number and the character of the witnesses, in all of whom the necessary psychical conditions of vision cannot be assumed as present. The records in the Gospels of the appearances, while not contradictory, cannot be entirely harmonised; but they are not the oldest literary evidence. That is found in 1 Cor. xv, 1-11, written at a date so near the event itself as to preclude the growth of a myth, while Paul's conversion is the most striking proof of the presence and operation of the Risen Lord. See Incarnation; Jesus Christ.

Darragh, 1921; Do Dead Men Live Again?, V. F. Storr, 1932; And the Life Everlasting, J. Baillie, 1934; Is the Resurrection True?, D. F. Brundt, 1934; Conquest of Death, F. T. Lord, 1940; The Resurrection of Christ, A. M. Ramsey, 1945; The Gospel of the Hereafter, J. P. Smith, new ed., 1948.

Resurrection Bay. Inlet of Alaska, on the S.E. coast of Kenai peninsula. From the bay was launched in 1794 the first vessel built in Alaska (q.v.).

Resurrection Men. Term for men who made a practice of disinterring dead bodies, usually those just buried. They did this in order to sell them to medical students and others for dissecting purposes. They were known as body snatchers. In England the practice was prevalent between about 1760 and 1840. See Bodysnatching; Burke and Hare.

Resuscitation (Lat. *resuscitare*, to raise again). Revival of persons apparently dead from the effects of shock, e.g. electrical, suffocation, asphyxiation, syncope, etc. The commonest form of apparent lifelessness is that due to syncope or fainting. In such cases the feet should be raised and the head lowered. The recumbent position in all cases requiring resuscitation, indeed, is one of the first things which should be obtained. This should be followed by the loosening of any tight articles of clothing, e.g. collar, corsets, etc., which may impede respiration, and plenty of air should be allowed to reach the patient. In serious cases the heart action may be stimulated and respiration increased by sprinkling the face with water, or by the application of spirits of camphor or weak ammonia or smelling salts to the nostrils, and by giving a small dose of brandy or other spirit. In extreme cases artificial respiration (q.v.) and stronger restoratives must be resorted to in order to restore the sufferer.

Those suffering from electric shock should be revived by artificial respiration, and heat should be applied to the limbs. Brandy, strychnine, and other stimulants should be administered. In cases of poisoning from coal gas and carbonic dioxide, artificial respiration should be tried, and oxygen administered when possible.

Resuscitation of newly born babies cannot be attempted by the ordinary methods of artificial respiration. The baby must have air first of all introduced into its lungs, the best way being by direct insufflation from the mouth of the nurse, or other person present, a method practised by shepherds with newly born lambs from time immemorial. See First Aid.

Reszke, ÉDOUARD DE (1855-1917). Polish singer. Brother of Jean de Reszke, he was born in Warsaw, Dec. 23, 1855, studied singing at Milan and Naples, and became a leading bass at the Théâtre Italien, Paris, 1876, later joining the Opéra there. His bass voice had fine quality and training, and he acquired dramatic abilities.

Edouard de Reszke as Mephistopheles

and Paris, and died May 29, 1917.

Reszke, JEAN DE (1850-1925). Polish singer. Born at Warsaw, Jan. 14, 1850, he went to the university and studied singing in Italy. He appeared as a baritone in opera in Venice, 1874, London, 1875, and Paris, 1876. Turning tenor, he made a sensation by his performance in Madrid, 1879, and in Paris, 1883, in *Hérodiade*, and *Le Cid* of Massenet, and from 1888 to 1900 performed regularly at Covent Garden. His tenor voice was singularly pure and well controlled, and his Wagnerian performances were memorable. He played in the Paris Opéra before retiring through ill-health, 1904. He died April 3, 1925.

Retail Distribution. Process by which commodities are sold to the public. It is essentially concerned with the sale of consumable goods, and not with that of raw materials or capital goods to industrial consumers. Retail distribution represents the last stage in the distributive process of a commodity. The process may be long and complex, when for instance a commodity passes through the hands of wholesalers, merchants, or factors; when it has to be stored or processed before being sold to retail distributors; and when it has to be transported from far distances; but all these stages are simplified when a farm supplies milk direct to consumers or a baker sells bread to the neighbouring customers.

The bulk of the retail business is done in shops and performed by shopkeepers or companies owning stores, and their assistants. But a great deal is also done by other

outlets. There are markets and stalls, street vendors, barrow dealers, and hawkers; some farmers still sell fruit and vegetables from their carts to neighbouring districts; commercial travellers and agents sell household appliances retail on their home-to-home visits; manufacturers may even supply certain goods direct to private consumers, avoiding wholesalers and retailers, as when sports and games equipment is sold to clubs and other clients direct; even the slot-machine represents a non-shop facility.

Jean de Reszke as Lohengrin

Then there is the mail order business with its wide ramifications. The potential customer for one reason or another is in a position neither to see nor to handle the actual merchandise, and so the selling appeal has to be made to him by post, mostly through the medium of catalogues and press advertisements and also by sending small samples. The mail order organization has been mainly developed in the U.S.A., where the large distances favour it; in 1939 there were in the country 534 mail-order houses with an annual sale of \$537 millions. Service trades may also be connected with retailing, although they generally do not constitute shops. A barber occupies a shop, though he is not strictly a shopkeeper; yet he may sell cosmetics, toilet soap, razor blades, brushes, and combs, in competition with pharmacists or ironmongers; garages or petrol filling stations may sell motor car accessories; restaurants, which are not to be regarded as shops, may sell cigarettes and sweets and have a bookstall. The report of the census of distribution committee in 1946 drew attention to such non-shop channels of retail distribution.

A trial census of retail distribution was carried out for six British towns in 1936 by a group of business firms. It may be expected that the total for Great Britain will lie in the neighbourhood of 800,000-900,000 shops. There are probably two million shop assistants; the number of workers employed in the distributive trades in 1939 was stated to have been 2,900,000. The average number of shop assistants employed in retail outlets varies, according to Dr. Henry Smith, from 0.3 per shop in certain trades to over 2.0 in others. Sometimes in an urban district the shops situated in the centre of the town represent 75 p.c. of the total value of the turnover of the whole district, while 75 p.c. of the shops,

scattered in the suburbs, may represent not more than 25 p.c. of the value of the retail trade. Not merely the number of shops, but also their turnover, must be considered in order to assess their economic and social significance.

The number of single retail outlets is probably greatest in grocery and provisions (of which Dr. Smith gave an estimate of 92,700 retail outlets), followed by textiles and other clothing, meat, and green-grocery; but he also estimated the number of general and mixed businesses at 78,500. There are trades in which a population of less than 500 is on the average served by one shop, as with grocery and provisions, while with ironmongery, furniture, or boots and shoes the figure may well exceed 3,000, and be far higher with such expensive trades as that of motor cars. In spite of the increase in department stores and bazaars, the multitude of shops shows yet no sign of reduction, and with the extension of suburban dwellings and satellite towns there is little reason to expect any.

TYPES OF SHOPS. The main distinction is first between small, independent retail shops and the department and other big stores; independent retail shops may be owned by a company, a partnership, or an individual, and they may or may not be managed by the owner. A department store can be regarded as an aggregation of shops in one building and under one control, the characteristic being that there exist separate department accounts for each section. The small independent retail shops are far more numerous than any other type; their number in Great Britain is frequently given as about 650,000.

Multiple and Chain Stores

Such classifications as to size must be distinguished from those relating to the commercial and financial organizations of retail outlets. Multiple and chain stores represent a new and progressive development. The definition of the multiple shop already officially in use is that it belongs to a trading concern having ten or more branches. The retail unit is here multiplied in a number of different shopping areas, either locally or nationally, and the resulting multiple organization is controlled by one central management. It is not the size of the single shop which is the characteristic, but the commercial and financial organization by which it tries to concentrate

the buying of merchandise in bulk and spread it over a large number of retail outlets of the same type; thus are secured the economic advantages of buying in large quantities, concentrating on certain goods which most people have been found to want, and through this reducing overheads. This type of organization finds expression along three distinct lines:

(1) *The ordinary multiple shop company* distributes merchandise covered by a single trade, e.g., groceries, tobacco, stationery.

(2) *The cooperative societies* are built up on the principle of eliminating intermediary trading stages between the manufacturer and the consumer by organizing consumers into associative bulk-buying bodies, dividing the surpluses accruing in the form of "dividends" to members.

(3) *The "fixed price" chain stores*, like the cooperative stores, resemble the structure of the departmental store or bazaar in their variety of merchandise, but selling prices are restricted to cheap and mass-produced commodities which can be easily ranged into a few price categories. Started in the U.S.A., they spread later to the U.K. and other countries of Europe. The changes in conditions of production during and after the Second Great War put an end, temporarily at least, to the "fixed prices" charged by such stores.

An important aspect of retailing is club or check trading. This tries to assist consumers by credit-giving facilities, as also does hire-purchase selling. The former type of trading assumes two forms: there are clubs (mostly in the clothing trade) into which a member pays a weekly deposit, receiving interest, and using both principal and interest at the end of an agreed period to make purchases at some specified shops; and clubs in which the member may receive the goods he wants to buy before he has actually completed payment for them. Club trading has been much criticised for the increase in the distributive cost involved by the employment of large staffs of canvassers and agents.

Modern development of retailing has shown a tendency to combine manufacturing, wholesaling, and retailing within one business. But it seems that this system is applicable only where commodities can be standardised and sold in large quantities. Yet there can be no doubt that the position of the small, independent retailer is in many ways threatened through the

development of chain, cooperative, and department stores. He has still the best chances where proximity to customers gives him an advantage, where he can offer personal service and delivery to nearby customers, and where as an artisan-retailer he can offer skill in service and repair work.

Retail trade associations are on the one hand intended to further the interest of members by advice, information, statistical research, and official representation in important trade matters; on the other hand, they mostly pursue a policy directly concerned with practical and specific trade issues, such as prices and the fixing of distributive margins, the regulation of competition, price maintenance, regulation of entry to a trade. In those respects they aim at a restriction of retail competition; and they sometimes support proposals for the registration and licensing of shops.

Hermann Levy

Bibliography. Practical Aspects of Retailing, J. L. Courtney, 1939; Retail Trade Associations, H. Levy, 2nd ed. 1944; A Nation of Shopkeepers, T. S. Rothwell, 1947; The Shops of Britain, H. Levy, 1948; Retail Distribution, H. Smith, 2nd ed. 1948.

Retainer. Fee of a nominal amount paid to a barrister in order to retain his services either generally, or for a particular case. A barrister so retained has a right to be briefed at a fee proportioned to his rank and standing at the bar, and once he has accepted a retainer he cannot accept a brief for the other side, no matter how tempting a fee they may offer him. A brief fee, which is of substantial amount, is frequently, though wrongly, described as a retainer. See Barrister; Brief.

Retaining Wall. Wall of brickwork, masonry, mass concrete, or reinforced concrete, built to retain earth at the back where there is a drop in level in the land, as in a cutting, terrace, or embankment. In civil engineering large examples may be found in rly. and dock construction. The larger types in building construction are used to retain earth around deep basements and sunken approach drives; the smaller to retain earth in terraces, shallow basements, and around boundaries where the ground or garden is a few feet higher than the road outside.

These walls may be of solid brickwork or other material in which stability depends upon mass or weight, or of reinforced concrete so designed that the steel rein-

forcement takes the tensile and shear stresses and the monolithic construction of wall and foundation prevents overturning. For small retaining walls mass construction is usually adopted, as in Figs. 1, 2, 3, and 4; but for high ones reinforced concrete is cheaper, and two examples are shown in Figs. 5 and 6.

A simple rule for designing mass brickwork and masonry retaining walls is to make the thick-

Retaining Wall. Examples of various types. See text

ness at the base one-third of the height from the top of the foundation to the top of the wall. For a high wall this may be progressively reduced by half at the top of the wall, provided the retained earth is compact and the foundation adequate. Alternatively, the face may be battered (sloped) back, the base thickness being one-third the height and the top thickness one-fifth the height. If the retained earth is rather loose, projecting piers should be built on the wall at intervals of about 12 ft.

Reinforced concrete retaining walls require less bulk of material than mass walls, but greater skill in design and construction. As they tend to bend outwards, the steel reinforcement is placed near the back to take the tensile (pulling) stress. The toe foundation may project inward, as in Fig. 5, where the weight of the retained earth holds it down; or outward, as in Fig. 6, where it bears on the ground.

Retaining walls must have open weep holes at intervals near the base, so that water from the earth can be drained away and no liquid pressure is exerted at the back of the wall. See Building.

Retention. Scots legal term for the right of a creditor to retain the property of a debtor until the latter has paid his debt to him. The right is limited to the special purposes and conditions of the deposit.

Retford, EAST. Mun. borough and market town of Notts, England. It stands on the river Idle, a canal, and the Great North Road, 138 m. N.N.W. of London, and is a rly. junction. The principal church is S. Swithin's,

which was rebuilt in the 17th century, and the chief secular buildings are the town hall, corn exchange, and grammar school, founded in 1552. The industries include corn mills, iron foundries, engineering, rubber, and dye works, and paper mills. A large agricultural trade centres in a covered market. In the Middle Ages East Retford became a borough, and held fairs and markets. It was separately represented in parliament from 1315 to 1885. In 1830 the hundred of Bassetlaw was made part of the constituency, and now gives its name to the whole. West Retford is part of the borough. Market day, Sat. 15, 900.

Rethel. Town of France. In the dept of Ardennes, it stands on the Aisne and the Canal des Ardennes, 23 m. N.E. of Reims. The chief buildings are the church of S. Nicholas and the Hôtel Dieu. A Roman settlement, Rethel was an important place in the Middle Ages, when a priory was founded. It was the capital of a county, at one time part of Burgundy; this was made a duchy in 1581. Here Turenne, fighting for the Fronde, lost a battle, Dec. 15, 1650, but on the royalist side he captured the place in 1653. It figured in the First Great War battles of the Aisne.

Reticulum (Lat., little net). In astronomy, a southern circum-polar constellation, one of the four which border on the Greater Magellanic Cloud between Hydrus and Dorado. It was so named by Lacaille. See Constellation.

Retimo or **RETHYMNON**. Port and town of Crete, the ancient Rhethymnos. On the N. coast, about 49 m. W. of Candia, it has a shipping trade in olive oil and valonia. Pop. 8,632. Retimo gives its name to a dept. with pop. 76,141. See Crete.

Retina. Membrane composed of ten layers of tissue. It forms the

innermost covering of the interior of the eyeball, extending forwards to within a short distance of the margin of the pupil. It is formed by an expansion of the optic nerve. The retina is the structure upon which fall images formed by rays of light passing through the lens, and it transmits through its complex layers the stimulus caused by the image, thus giving rise to the sensation of vision.

Inflammation of the retina (retinitis) accompanies kidney disease, syphilis, etc. Detachment of the retina, due to a blow, or to physical strain in very short-sighted persons, causes complete or partial blindness. See Eye.

Retort (Lat. *retortus*, bent back, twisted). Generally, an apparatus in which a mixture or compound is broken up by the aid of heat or chemical action. One or more of the constituents of the contents of the retort is volatilised and expelled from the apparatus into another appliance where it may be condensed or absorbed and so collected. There are three broad classes: first, the appliance of the chemical laboratory, usually of glass, but sometimes of earthenware, clay, or metal; second, the fireclay or iron chamber of the ordinary gas works in which coal is destructively distilled, and from which the crude gas issues to the hydraulic main; and third, the vessels of various shapes and materials used by the metallurgist for extracting metals from their ores and for separating the metals of amalgams. The term is also sometimes applied to the containers or muffles in which iron is converted into steel by contact with carbon. A still is a retort. See Charcoal; Distillation; Mercury; Zinc.

Retreat (Lat. *retrahere*, to draw back). Military term to describe a retirement before the enemy. When carried out for strategic reasons, so as to secure a better position for fighting, a retreat is more correctly a withdrawal and implies order and cohesion. A notable strategic withdrawal of the Second Great War was that of the British Army to Egypt in 1941, while the British retreat through Burma into India in 1942 began as a retreat but developed into a strategic withdrawal. A retreat is strictly a deliberate attempt to break off engagement and fall back without any effort being made to form a fixed line of resistance. Notable retreats are those of the Ten Thousand described by Xenophon, Sir John Moore's retreat on Corunna in 1808, Napoleon's retreat from

Moscow in 1812 and the retreat from Mons in 1914. In the Second Great War, there were the retreat on Dunkirk, Rommell's rout in N. Africa in 1943, and the German armies' retreat into Germany in 1945. Retreat is also the name of a military bugle call to assemble pickets and put the guard on a night footing. A ceremonial retreat is played in the evening by the fife and drum band marching and counter-marching on the square.

Retreat. Place of retirement for religious exercises and meditation. The word is applied to a monastery, convent, or hermitage, e.g. S. Joseph's retreat, Highgate, London, mother house in England of the Passionists (*q.v.*), and Jordans, Bucks, the retreat of the Society of Friends.

Retriever. Sporting dog of the spaniel group, produced by a cross between the lesser black Newfoundland

Retriever. Flat-coated retriever, a British sporting dog

land and the water spaniel. Often a strain of setter blood has been introduced. It is used for retrieving game on land as the water spaniel does in water. There are four types of retriever recognized by sportsmen. The Labrador is as a rule merely a small black breed of Newfoundland; the flat or wavy-coated is the result of a cross between the Labrador and setter; the curly-coated is considered by most authorities to be a cross between the Labrador and water spaniel, and is equally good in water or on land; the golden retriever is derived from the flat-coated retriever, but is of a rich golden colour. The first three varieties are usually black or liver-coloured. A retriever should have what is known as a tender mouth, and should hold the game without mangling it. Some of these dogs will carry a bird so gently as not even to displace its feathers. See Dog colour plate.

Retrograde Motion (Lat. *retro*, back; *gradī*, to walk). In astronomy, the motion of a planet or the satellite of a planet when it is in the direction opposite to the general

direction of motion. The moons of Uranus and that of Neptune, the ninth satellite of Saturn, and three outer satellites of Jupiter revolve about their planets in a direction contrary to that of all other members of the solar system. The term is also applied to the backward movements of planets in the skies as seen from the earth. Many comets also have a retrograde motion.

Retrogression. In music, a contrapuntal device by which the theme or subject is repeated by being played backwards. It is also known as retrograde imitation. See Counterpoint.

Returning Officer. Official who conducts an election. In parliamentary elections the duties are performed by the sheriff in counties, and in boroughs by the mayor. Certain expenses incurred are allowed by statute. On the issue of the writ the returning officer receives nominations for the vacant seat, and also the cautionary deposit of £150 from each candidate. It is also his duty, sometimes by deputy, to see that the election is held in the manner prescribed by law. He announces the result and reports it in proper form to the Speaker. See Election.

Return of the Native, THE. Thomas Hardy's sixth novel, regarded by some critics as his finest. In this tragedy, published 1878, are presented people who have remained in their rustic outlook and others who have been educated into something different. In the emotional instability which follows their meeting, they marry unsuitable partners. The characters are all vividly drawn; but the chief character—also the one first introduced—is Egdon Heath in all its seasons.

Retz, RAIS, OR RAIZ, GILLES DE (c. 1396–1440). French soldier and criminal. Born of the Laval family, he served in the wars and was made marshal of France. Later he was tried on a charge of disobedience to the authority of John VI of Brittany, and the discovery was made that he had engaged in an almost incredible series of murders and debauches. Human remains were found at Vannes, Chantocé, Machecoul, Nantes, Rais, Tiffange, etc., and it was estimated that some 150 children

and numerous women had met death at his hands. He was hanged and burnt at Nantes, Oct. 25, 1440. Perrault's story of Bluebeard may be founded on his career.

Retz, JEAN FRANÇOIS PAUL DE GONDI, CARDINAL DE (1613–79). French ecclesiastic and writer.

He was born at Montmirail, Sept. 20, 1613, and was educated for the Church, and was made coadjutor to his uncle the archbishop of Paris, 1643, succeeding him in 1654. He was a prominent enemy of Mazarin before and during the Fronde (*q.v.*), but became a cardinal despite Mazarin's opposition. Imprisoned in 1652, he escaped in 1654, and lived abroad until the death of Mazarin, becoming abbot of St. Denis, 1662. He retired to St. Mihiel, and died in Paris, Aug. 24, 1679. De Retz had always won the people's favour by his charitable gifts, and his last years were devoted to philanthropy and religion. He had his periods of social brilliance and dissoluteness, and has enshrined in his vivid Memoirs (pub. 1717, Eng. trans. 1904) the period 1643–55, the account being marred by bias. His works were edited 1870–96. *Pron.* Race.

Reuchlin, JOHANN (1455–1522). German scholar. Born at Pforzheim, Feb. 22, 1455, a cousin of Melancthon, he visited most of the seats of learning in Europe, studied Greek, Latin, and Hebrew, and taught jurisprudence and literature. He was private secretary to the court of Lorenzo de' Medici at Florence, a judge of the Swabian League, and held professorships at Wittenberg, Ingolstadt, and Tübingen. His Rudimenta Linguae Hebraicae, 1506, gave a remarkable impetus to the study of the Hebrew text of the Bible. When the destruction of Jewish books except the O.T. was proposed, he aroused controversy by maintaining that only those of pronounced anti-Christian character should be condemned. He published a Greek grammar and a Latin lexicon, edited Greek texts, and wrote De Verbo Mirifico, 1494; and De Arte Cabbalistica, 1517. He died at Liebenzell, Bavaria, June 30, 1522. See Renaissance. *Pron.* Roikhlin.

Reunion. Term applied to the policy of uniting different Christian Churches. The multiplicity of

Cardinal de Retz, French writer

Gilles de Retz, French soldier

Churches began after the Reformation by a kind of cellular process in which new Churches split off from older bodies. In the 16th century the Baptists, in the 17th the Congregationalists; and in the 18th the Methodists broke away from the Church of England. In 1843 the Free Church of Scotland separated from the Established Church of Scotland. During the 19th century the tendency was reversed, the prospective reunion of the separated Churches coming under discussion; but it was not until the 20th century that effective steps were taken. In 1900 the Free Church and the United Presbyterian Churches combined to form the United Free Church of Scotland. The process was quickened by the First Great War, when the non-Roman Churches began to draw together. Anglicans and Orthodox (Eastern) bishops met at the Lambeth Conference of 1920 and an appeal for religious unity was issued. The first great international Church conference took place at Stockholm (1925), promoted by Archbishop Söderblom of Sweden and Bishop Brent of the U.S.A. This was followed by other conferences at Lausanne (1927), Oxford, and Edinburgh (1937). In 1948 the first world council of Churches was constituted at Amsterdam. In the meantime practical steps for effective reunion had been taken; in China the Presbyterians and Congregationalists became the United Church of Christ (1921); in Africa the Church of Scotland, the United Free Church of Scotland, and the Dutch Reformed Church united to form the Church of Central Africa (1924); in Canada the Methodists, Presbyterian, and Congregational Churches became the United Church (1925); the reunion of the Established Church and the United Free Church of Scotland in 1929 healed the schism of 1843; in England the Wesleyan, Primitive, and United Methodists united to form one Church (1932); in S. India the Presbyterians and Congregationalists, who had united in 1908, joined the Wesleyans and Anglicans to form the South India United Church (1947). In the U.S.A. after discussions lasting for over 50 years, the Methodists united in 1940 to form the largest Protestant community in the country (8,000,000), and the United Brethren and Episcopal Church united in 1946. Discussions have taken place there between the Protestant Episcopal Church and the Presbyterians; in Canada similar discus-

sions have gone on between the Church of England and the United Church of Canada; and in Australia the Church of England has negotiated with the Congregationalists, Methodists, and Presbyterians. *Consult* The Church of England and the Free Churches, G. K. A. Bell and W. L. Robertson, 1925; Union of Christendom, B. K. MacKenzie, 1938; Christian Reunion, Hugh Martin (1941); Towards the United Church 1913-1947, W. J. Noble and others, 1947; Christian Unity, G. K. A. Bell, 1948.

Réunion, ÎLE DE LA. Island of the Indian Ocean, ranking, since 1947, as a department of France. It lies about 420 m. E. of Madagascar, and, measuring some 45 m. in length and 32 m. broad, has a total area of 970 sq. m. The surface is mountainous, and the island, of volcanic origin, is crowned by the extinct volcano, the Piton des Neiges, 10,070 ft. It is well watered, and has a fairly healthy climate. Sugar planting is the chief agricultural activity, other products including coffee, tea, tobacco, rubber, vanilla, cloves, manioc, rice, tapioca, and maize. Rum is manufactured in large quantities. A rly., built 1887, serves the chief centres.

The capital is St. Denis (pop. 32,637), other towns being St. Paul (23,055), St. Louis (20,867), and St. Pierre, (20,150). The island is administered by a governor, assisted by a privy council and an elected council-general. In Paris Réunion is represented by one senator and three deputies. Its mixed pop. totals 220,955, which includes 214,382 French.

Discovered by the Portuguese Pedro de Mascarenhas, 1513, it was taken over by a French explorer in 1638, and was known as Bourbon from 1649. From 1810 to 1815 it was in English hands, and was renamed Réunion when restored to France.

Reus. City of Spain, in the prov. of Tarragona. It is 10 m. by rly. W. of Tarragona, and 4 m. N. of Salou, its port on the Mediterranean. It is the most important commercial and industrial town in the province. It has an art academy, and handsome public buildings. The prosperity of the town dates from 1750, when an English colony here founded a trade in cottons, leather, wine, etc. It manufactures also hats, silk, soap, and linen, and exports flour, fruit, and brandy. Pop. 36,500.

Reuss. River of central Switzerland, a tributary of the Aar. It rises on the N. slope of Mt. St. Gotthard, in canton Uri, and, flow-

ing past Andermatt and Amsteg, enters the lake of Lucerne near Flüelen. Leaving it by the town of Lucerne, it flows through Aargau to unite with the Aar near Windisch after a course of about 90 m. See Aar; Rhine.

Reuss. Name of two former German principalities in Thuringia. In the Middle Ages this tract of land in central Germany came under the rule of a line of counts who were vassals of the emperor. One of them was known as der Russe (the Russian), and this became the name of his country. The two sections, each ruled by a prince, became known as Reuss-Greiz and Reuss-Schleiz-Gera. In 1918 their combined area was 441 sq. m., and their pop. 221,500. The reigning family had the curious custom of naming each male member Henry, the latest heir to the throne being a well-known theatrical director, and ranking as Henry XLV. In 1920 the states of Reuss united with the other Thuringian states in the free state of Thuringia (*q.v.*).

Reuter, GABRIELE (1859-1941). German novelist. Born Feb. 8, 1859, at Alexandria, Egypt, where her father was in business, she returned to Germany on his death, 1872, and eventually settled in Berlin. She had been writing fairly successful novels, 1876-94, when she produced a remarkable study of the feminine mind in *Aus guter Familie*, 1895. This achieved considerable success and was followed by *Liselotte von Reckling* (1904), *Benedikta* (1923), *Irmgard und ihr Brüder* (1930), and others. She died at Weimar in 1941. *Prom. Roiter.*

Reuter, LUDWIG VON (1869-1943). German sailor. Born Feb. 9, 1869, he entered the navy in 1885, commanding a cruiser squadron early in the First Great War. Rear-admiral at the time of the armistice, 1918, he was appointed commander of the fleet to be surrendered to the Allies. On Nov. 21, flying his flag in the battleship *Friedrich der Grosse*, he delivered up the German fleet to Beatty and took it to Scapa Flow. There on June 21, 1919, Reuter ordered the ships to be scuttled, his defence being that he believed the armistice had terminated. He published *Scapa Flow* in 1928. His death was announced Dec. 22, 1943.

Reuters. British news agency. It was founded by Julius Reuter (1816-1899), a bank clerk in Cassel who in 1849 began a pigeon post service to carry the closing prices of the Paris Bourse

between Brussels and Aix-la-Chapelle. This was so successful that he soon began handling general news. Shortly after the opening of the Calais-Dover cable in 1851 Reuter came to England and made London his headquarters. Within a few years Reuters developed into a universal network for the collection and transmission of news, having correspondents in all the principal towns and cities of the world.

Reuters reputation for accuracy and strict impartiality led to acceptance of the service by most newspapers. Julius Reuter, who became a naturalised British subject in 1853, conducted his agency as a family business until 1865, when he sold it to Reuters Telegram Company, of which he became managing director. As a joint stock company, Reuters shares could be freely bought and sold, and there was nothing to

Baron Reuter,
founder of the news
agency

prevent the agency coming under foreign control. Soon after the outbreak of the First Great War, a small private trust was established which purchased Reuters shares for £500,000 and ensured its British ownership. In 1947, a fresh trust was formed, and Reuters is now jointly owned and controlled by the Press Association, Newspaper Proprietors' Association, the New Zealand Press Association, and the Australian Associated Press. The trust deed provides that Reuters shall never pass into the hands of one interest or group, and that its integrity, independence, and freedom from bias shall be maintained. The head office of the agency is at 85, Fleet Street, London, E.C.4. Reuters was the subject of a film, *This Man Reuter*, with E. G. Robinson in the title rôle (1941).

Reutlingen. Town of Württemberg, Germany, at the entry of the river Echaz into the fertile Neckar plains, 20 m. S. of Stuttgart. Known since 1090, and a free city since 1240, it still contains, although wellnigh destroyed by fire in 1726, one of the country's most precious Late Gothic buildings, the church of S. Mary, built in the 13th and completed in the 14th century, with a tower 240 ft. high. Reutlingen has been the centre of several flourishing industries, in-

cluding leather, textiles, and engineering. It was a spa and possessed a technical college. A remarkable workers' settlement was built 1904-18. In 1945 Reutlingen came within the French occupation zone. Pop. 62,500.

Reval. Former name for Tallinn (*q.v.*), capital of Estonia S.S.R. **Reveille** (*Fr. réveiller*, to awake). Signal by beat of drum, or, more commonly, by bugle call, to rouse

Reveille. Notes as written for bugle, sounded to arouse troops in the morning

troops in the morning; also as a signal that sentries need no longer challenge. There are two notations for reveille, long and short; the latter is most commonly used in camps, while the former, seldom used, is reserved for ceremonial occasions. In certain Scottish regiments, but not the kilted ones, reveille is called on the bugle, followed by a longer, Scottish reveille on the bagpipes.

Revel. Term for a noisy, riotous feast or merry-making. It was applied to the English and Scottish foolery carried on under a lord of misrule or abbot of unreason (*q.v.*). At an early date entertainments at court were known as revels, and the official whose duty it was to arrange and control these entertainments was known as the master of the revels. The office is at least as old as the time of Edward III; by the time of Henry VIII it was of some importance, and in Elizabeth's reign the master of the revels, *magister jocorum, revelorum, et maseorum*, was made also dramatic censor. Sir Edmund Tilney held the office, 1579-1610, and his successor, Sir George Buc, wrote a treatise on the Art of Revels which has been lost. By 1737 the office seems to have died; the theatrical jurisdiction attached to it was, at all events, transferred to a legally appointed stage censor.

Revelation (*Lat., revelare*, unveil). Term describing the self-manifestation of God to man or the disclosure by God of Divine truth to man. In every form of religion there are two sides: (1) the quest of man for God; (2) the imparting by God of truth to man. The second aspect is known as revelation. Belief in it assumes the possibility that God can communicate knowledge of Himself to man. This communication is made in many forms. It may come through nature. As the Psalmist says: "The heavens declare the glory of God, and the firmament

showeth His handiwork." It may come through the enlightenment of the mind and the awakening of conscience. The Hebrew prophets felt that God had put His word into their mouths.

The older theories of inspiration maintained that the truths of revelation were verbally dictated to the prophets. That view is now completely abandoned (*see Prophecy*). "Spiritual things are

spiritually discerned." There must be a certain quality of mind and soul in the recipient before the Divine manifestation can be imparted, and the character of the revelation is always coloured and modified by the character of the personality to whom it is given. Hence there was a development in the process of revelation, because there was a growth in the capacity of men to receive the Divine truth. The O.T., therefore, is the record of the development of revelation, which continually works up towards its climax in Christianity. Christianity claims to be the perfect, complete, and final revelation of God. *See Bible; Inspiration.*

Revelation, THE. Last book of the N.T. The title is derived from the Greek word *apokalypsis* (unveiling, or revelation), and hence the book is often called the Apocalypse. It belongs to a special type of literature known as apocalyptic, and stands in the same class as the Book of Daniel and the many Jewish apocalypses which appeared in the intermediate period between the O.T. and N.T. Tradition ascribes the authorship of the book to John the Apostle, but ever since the time of Dionysius of Alexandria this has been questioned, and most modern scholars are agreed that it could not have been written by him.

The interpretation of the Apocalypse has always been a difficulty; while its strange and fantastic imagery has always appealed to the Christian mind, there has been the utmost diversity of opinion as to its meaning. Some theologians, known as Futurists, have held that its predictions are entirely concerned with the events connected with the end of the world. Others hold that it contains a prophetic forecast of the history of the world, from its own day to the end of time.

Both views are improbable, as they are in conflict with the writer's

own statement that he was speaking about things which were "shortly to come to pass," and moreover they are out of keeping with the genius of ancient prophecy. It is a mistake to suppose that the Book of The Revelation contains a cryptogram, by solving which it is possible for us to ascertain the date of the end of the age. The more likely interpretation is what is known as the Preterist, which holds that throughout the book the writer is speaking of the events (either actual or predicted) of his own day. The Church was face to face with a serious persecution which threatened its extinction. The conflict between Christianity and Caesar-worship was at its height. The Book of The Revelation was written to comfort and encourage the suffering Christians in the age of Domitian. It held out to them the promise, which was the main article in the Apocalyptic faith, of the intervention of God, Who would destroy their enemies and secure their own salvation. See Apocalypse; Bible; John, S. Consult The Book of Revelation, W. M. Milligan, 1919; E. E. Scott, 4th ed., 1945; The Lord Reigneth, A. W. Burnett, 1946.

Revelstoke. Town of British Columbia, Canada. On the Columbia river, 245 m. N.E. of Vancouver, it is a rly., mining, and timber centre, also a tourist centre for the Rocky Mts., with all-year-round ski-ing. Pop. 2,106.

Revenge. English warship. Of 500 tons and carrying 250 men, she bore Drake's flag against the Spanish Armada in 1588. She is more famous, however, for the circumstances of her destruction by Spaniards on Aug. 31, 1591, when her commander, Sir Richard Grenville, against orders attempted to pass through an enemy squadron. Engaging some fifteen warships, he fought for 15 hours until only a score of men were left alive. Tennyson's ballad has immortalised the episode by dwelling on Grenville's valour and overlooking his disobedience.

Reventlow. Name of a Danish family. Count Christian Reventlow (1748-1827), statesman and reformer, was born March 11, 1748. He held important administrative posts, and in 1786 induced the crown prince Frederick to appoint an agricultural commission which abolished villeinage. He died Oct. 11, 1827.

Count Ernst Christian Einar Ludwig Detlev Reventlow (1869-1943) was born Aug. 18, 1869, at

Husum, Slesvig-Holstein, then part of Prussia. After serving in the navy he wrote much on strategic and political subjects, and was an ardent pan-German politician before the First Great War. Elected to the Reichstag, 1924, he joined the Nazi party in 1927. He died at Munich, Nov. 21, 1943.

Count Eduard Reventlow (b. 1883), Danish diplomatist, was born Nov. 28, 1883, and educated at Copenhagen university. In the diplomatic service he held important posts in Copenhagen, Berlin, and Paris, 1909-13. He was minister in Stockholm, 1932-37, and in London from 1938, but was dismissed by the Copenhagen government in 1942 because he had become hon. president of the Free Danish movement in Great Britain. That position he occupied until 1945; he was then reinstated as minister, and in 1947 his status was raised to that of ambassador.

Revenue (Lat. *revenue*, to come back). Receipts or rents of any kind. The word is chiefly used, however, for the revenue of a state, as are the phrases national revenue and inland revenue. A revenue officer is an officer of the customs and excise; a revenue cutter, an armed vessel formerly used to prevent smuggling. See Customs; Income Tax; National Finance; Preventive Service.

Reverberatory Furnace. Type of furnace widely used in extraction metallurgy. The name derives from its principle. If solid fuel is used it is burned in a separate chamber; if liquid, gaseous, or powdered fuel is used it is burned at one end through special ports. Whatever the fuel, the products of combustion are led over a hearth so that they impinge on the roof of the furnace, which "reverberates" the heat down on to the charge. Small furnaces of this type have been used for many years in lead smelting, and since the beginning of the 20th century the application of the reverberatory furnace to copper smelting has advanced enormously.

Furnaces may be more than 100 ft. long and 20 ft. broad, and are worked continuously, the concentrate being added at suitable points through hoppers leading through the roof. A constant bath of molten matte is kept in the furnace and tapped off when needed, the slag being allowed to flow off. The limiting factor in size is the roof arch, as refractory materials could not be found to stand the high temperatures with

the enormous strain of a wide arch. The difficulty has been overcome by the use of a suspended roof of magnesite brick. Being supplied with external support at frequent intervals, the roof can be made much wider without danger. The open-hearth furnaces used for steel-making are similar in principle, and reverberatory furnaces will also roast ores and refine crude metal. See Furnace.

Revere, PAUL (1735-1818). American soldier. He was born in Boston, Mass., and at about 20

was an officer in the artillery. Later he was successively a goldsmith and a copper plate engraver. He took part in the destruction of tea in Boston Harbour, Dec. 16, 1773, and on April 18-19, 1775, rode out by night from Charleston to Lexington and other places, arousing the minute men to oppose the advance of the British troops on Concord. This exploit is the theme of Longfellow's poem, Paul Revere's Ride. He later founded the Revere Copper Co. at Canton, Mass., in 1801, and died May 10, 1818. Consult True Story of Paul Revere, C. F. Gettemy, 1905; P. R.'s Own Story, H. O'Brien, 1929.

Reverend (Lat. *reverendus*, worthy of respect). Courtesy title bestowed on all ministers of all denominations. In the Church of England archbishops are styled Most Reverend, bishops Right Reverend, and deans Very Reverend. Priests and deacons and Nonconformist ministers are styled Reverend throughout the British Empire and in the U.S.A. In Scotland, the moderator of the General Assembly is styled Right Reverend, and the principals of the universities, if in orders, Very Reverend. In R.C. countries priests are styled Reverend Father, and abbesses and prioresses Reverend Mother. It should be noted that in speaking or writing, the prefix Reverend is not a substitute for Mr., i.e. "The Rev. Smith" is incorrect; the form should be either the Rev. Mr. Smith, the Rev. J. Smith, or plain Mr. Smith. See Clergy.

Reversing Layer. In astronomy, a layer or stratum in the sun's atmosphere, immediately overlying and at a rather lower temperature than the actual solar

Paul Revere,
American soldier

surface. The spectrum of the sun is ordinarily crossed by a very large number of dark lines. According to theory they are produced by the absorptive effect of incandescent gaseous substances in the sun's atmosphere. These gaseous materials are themselves glowing, but the lines they produce are relatively dark against the more brightly glowing background of the sun.

On the occasion of an eclipse the sun's brightness is out off; and, as was first seen at the eclipse of 1870, the spectrum hitherto crossed by dark lines becomes suddenly covered with bright ones, as if the dark lines had become reversed. This flash spectrum (*q.v.*) was attributed by Young to the presence of the reversing layer, which is not nowadays, however, distinguished from the base of the chromosphere (*q.v.*). See Fraunhofer Lines; Photosphere; Spectroscopy; Sun.

Reversion (Lat. *revertere*, to turn back). Term used in English law. It denotes the estate which remains in a grantor after the determination of a particular estate granted by him. Thus A, the owner in fee simple of a house, grants a lease to B for 99 years. A is said to have the reversion expectant on the determination of the lease. If B in his turn grants a sub-lease to C for 21 years, B again has the reversion expectant on the determination of the sub-lease. A's reversion is called a freehold reversion, and B's a leasehold reversion. It is quite competent for A to grant another lease, to come into force after the expiration of B's lease, and such a lease is called a reversionary lease.

Reversion to type is a biological term expressing the reappearance of an ancestral characteristic. It may happen in two ways. The individual may revert towards an ancestor through the loss of some power of development in the germ-cell from which he sprang. Secondly, he may reproduce an ancestral characteristic which has been missing in recent generations. Reversions to type occur occasionally when domestic varieties of animals are crossed experimentally, but they also arise in pure-bred individuals. Thus, in purely bred races of pigeons of every kind known in Europe, blue birds occasionally appear, which is a reversion. See Atavism; Biology; Heredity.

Review of Reviews, THE. A former British monthly periodical. It was founded in 1890 by

W. T. Stead (*q.v.*), to provide a synopsis of the best articles in the reviews and magazines of the month, together with a survey of current events. Its success led to the foundation of an American edition in 1891 and an Australian edition in 1892. After Stead's death it passed through several changes until in 1923 H. Wickham Steed became proprietor and editor, remaining until 1930. When Edward Hulton took over control in 1940, the periodical was renamed *World Review*.

Revising Barrister. Person formerly appointed under the Registration of Electors Act to investigate claims and objections to the admission of names on the register of persons entitled to a parliamentary vote. See Barrister; Election; Registration.

Revival (Lat. *re*, again; *vivere*, to live). Term used for a recovery of any kind, *e.g.* of culture or trade. In a religious sense it refers to any movement for promoting and awakening religious zeal and enthusiasm. Examples are the Franciscan revival in the 13th century, and the Wesleyan in the 18th. In its more modern sense the term is used for movements among the evangelical denominations—especially in the Free Churches—in which great outbreaks of fervour have accompanied the meeting conducted by popular preachers. Among these may be mentioned the work of Moody and Sankey in 1874, and the Welsh revival under Evan Roberts in 1905. "Billy" Sunday, a baseball player ordained in the Presbyterian Ministry in 1905, was a celebrated revivalist preacher. See Methodism; Moody, D. L.; Sunday, W.; Wesley, J.

Revival of Learning. European movement from the 14th to the 16th century consisting of a renewed interest in and knowledge of the Greek and Latin languages, literature, and antiquities. An important phase of the Renaissance, it began about 1350 with Petrarch and others. Learned Greeks taught in Italy, Greek and Latin classics were rediscovered, and monastic education was replaced by that based on Humanism. The dissemination of Greek scholars through Europe after the fall of Constantinople to the Turks in 1453 accelerated the process. The invention of printing powerfully aided the movement, which had spent its force in Italy by 1520 and spread northward. See Bembo, P.; Education; Erasmus, D.; Humanism; Library; Miran-

dola, P. della; Petrarch, F.; Poliziano, A.; Printing; Renaissance; Reuchlin, J.

Revocation (Lat., calling back). In English law, taking back, annulment, or cancellation of a thing done or granted. A contract may be revoked by mutual consent before anything is done under it. A will may always be revoked; and it is frequently advisable, on making a fresh will, to say, "I revoke all former wills by me made." The authority of an agent is revoked by the death or bankruptcy of his principal. The word is also used for the annulling of any law, *e.g.* the revocation of the edict of Nantes in 1685.

Revolt of Islam, THE. Poem in twelve cantos by Shelley. Originally printed in 1817 as *Laon and Cythna*, or the Revolution of the Golden City: A Vision of the Nineteenth Century, it was suppressed and published in the following year under its present title. Written in Spenserian stanzas, it has many beautiful passages, but lacks any sufficient plot to hold the interest through nearly 5,000 lines. It is a story of revolution produced by the individual genius of the hero and heroine, the Golden City being Constantinople.

Revolution (Lat. *re*, again; *volvere*, to turn). Term used for the motion of any body round a centre or axis, for instance the revolution of the moon round the earth. In political science the word refers to any violent political change, such as the forcible overthrow of a regular form of government. It is thus opposed to reform, which implies a gradual change carried out by constitutional methods. In England the substitution in 1688 of William III for James II, although bloodless, is known as the Great Revolution. Other examples are the French Revolution of 1789, the American of 1776, and the overthrow of the tsarist regime in Russia, 1917. "The year of revolutions" was 1848, when there were movements all over Europe demanding constitutional government in place of despotism. The change that turned Great Britain from an agricultural into a manufacturing country is known as the Industrial Revolution (*q.v.*). See England; History; French Revolution.

Revolver. Pistol with a revolving cylinder, comprising a group of cartridge chambers, capable of firing a number of shots without reloading. The principle of revolving barrels is of consider-

able antiquity, and a few specimens of flint-lock revolvers are known. The complication was, however, too great for firearms of that nature to have much vogue, and the advent of the percussion cap was necessary for the revolver to become a success.

The "pepper-box," one of the earliest varieties, is fairly well

known. It had four or six barrels, generally all bored in the same block of metal, which rotated round a central axis as the hammer was worked. The development of the revolver is chiefly due to the efforts of Colonel Colt, who devoted much time to the subject from 1835. By that date he had produced an efficient weapon having one barrel and a revolving cylinder with six chambers. The latter were muzzle-loading and the hammer had to be cocked by hand for each shot, i.e. the revolver was of the type known as "single action." It was extremely reliable and accurate.

Breech-loading revolvers began to appear about 1850. By 1870 most revolvers were breech-loading, and central fire ammunition had been introduced. It had displaced all other varieties for the larger calibres, although pin-fire ammunition is still used in cheap Belgian revolvers, whilst rim-fire is paramount for .22 calibre. Up to 1890 most revolvers were of the solid frame type, the empty cartridge cases being ejected one at a time through a slot in the end plate by means of a sliding pin, and all were single-acting.

The self-ejecting type was invented by Smith and Wesson, the barrel and cylinder together pivoting on the frame, the action of "breaking" the revolver causing a flange on the end of the cylinder to rise and throw out all empty cases. Double-action revolvers, i.e. those in which a long pull on the trigger cocks the hammer and then lets it fall to fire the shot, also became general about the same time. In ejecting mechanism of this type it is essential that the catch holding the barrel to the top of the frame be of sound construction, and many experts hold the view that this type is unsafe for a weapon of

greater calibre than .32. The Colt system overcomes this objection by the use of a solid frame, i.e. the barrel and the frame are constructed from one piece of metal, the cylinder being carried in a small sub-frame, mounted on an axis at its lower edge so that the cylinder may be swung out sideways, and all the empty cases ejected by

century. In its earlier form, in Paris, produced generally in Dec., it was a review, satirical and frivolous, intermingled with song and dance, of the events and fashions and preoccupations of the year—*Revue de fin d'année* was the full designation. Revues later became heterogeneous musical entertainments, largely dependent for success on the personalities of the performers.

Revue des Deux Mondes. Outstanding French periodical which appeared twice monthly from 1829 to the Second Great War. Dealing with politics, history, literature, and art, it was edited by François Buloz, 1831-93; the historian Ferdinand Brune-

Revolver. 1. Colt's original type. 2. Smith and Wesson 8-chamber pattern, with single round enlarged to show blunt lead bullet. 3. Self-extracting safety revolver, open for ejector to throw out spent rounds. 4. Webley-Fosbery automatic service pattern, in which body recoils on frame to revolve chamber

pressing one pin. A revolver of this type is perfectly safe when using the most powerful cartridges. The calibres in most common use in England are .22, .32, and .38, this last being the military weapon.

In recent years the revolver as a pocket weapon has been to a certain extent replaced by the automatic pistol, which is more portable and gives more rapid fire. The lower velocity of the revolver bullet, however, makes it more efficient for stopping an assailant; a misfire is also a matter of less consequence, and a revolver is much more reliable where a weapon is required for heavy use, or where it is liable to become dirty.

If revolvers or pistols are to remain in good order it is essential that they be thoroughly cleaned after use, since modern smokeless nitro powders leave an acid residue which quickly causes rust unless it is cleaned away. The special "nitro-solvents" sold for this purpose are a combination of a mineral oil with alkali which neutralises the residue. *See* Ammunition; Bullet; Cartridge; Firearms; Gun; Gunpowder; Pistol; Rifle.

Revue. Form of theatrical production. Of French origin, it became popular in London from the second decade of the 20th

tière, 1893-1907; and from 1916 by René Doumic, his pupil, like him a member of the Academy. It had Hanotaux and Poincaré among regular contributors, and a moderately nationalist and Conservative trend.

Rewa OR **REWAF.** Largest and chief state of those forming the Vindhya union, India; covering some 13,000 sq. m. in the hilly part of the Bagelkhand. The chief rivers are the Sone and the Tons. The main crops are rice, millet, and wheat, but much of the land is covered with forest. Ruled by Baghel Rajputs, the state was in friendly relations with the British from 1812. Pop. 1,820,445. Its capital, Rewa, is 75 m. S.S.W. of Allahabad. Pop. 31,000.

Rewakantha. Former agency of native states, in Bombay, India. In 1944 all were absorbed by the Gujarat states agency, merged 1947-48 in Bombay state. To the N.E. of Baroda, the territory is crossed by the rly. from Baroda to Ratlam, and by the Mahi river. There are large areas of forest. The inhabitants are Bhils and Kolis.

Reward. Voluntary recompense for voluntary service. In law, where an advertisement is published, offering a reward to anyone who does something, e.g.

gives certain information or restores lost property, anyone who does the act is legally entitled to the reward. In other words, there

Reykjavik. Capital and seaport of Iceland. It stands on the Kollafjord, an opening of the S.W. coast. Among chief buildings are

Reykjavik. General view of the capital of Iceland

is a valid contract. It is a punishable offence to advertise a reward for the return of stolen property, "no questions asked," for this is condoning a crime. The Corrupt Practices Act, 1883, prohibits the offering of a reward to a voter for his vote, and here reward means not only money, but money's worth, e.g. an offer of employment, or gifts in kind.

Rewari. Town of Punjab, India, in Gurgaon dist. It is a rly. junction 32 m. S.W. of Gurgaon. The town is of great antiquity. It reached its present importance as a trading centre in iron, salt, sugar, and wheat under British rule. Fine turbans and brass and pewter vessels are the chief manufactures. Pop. 30,000.

Rexist Party. Former political party in Belgium. Established by Léon Degrelle (q.v.) in 1935 from reactionary members of the Catholic party, it advocated a totalitarian policy, and maintained a close connexion with Hitler and Mussolini. Uncompromisingly anti-Socialist, the Rexists gained 21 seats at the general election in 1936. In March, 1937, Degrelle stood personally in a by-election against the then Belgian premier, van Zeeland, and was decisively beaten; this was a serious setback for the Rexists, and in the election of 1939 only four of their members were elected. When the Germans invaded Belgium in May, 1940, the Belgian govt. outlawed the Rexists and imprisoned Degrelle. The party was revived by the Germans, with whom it collaborated during the occupation, but was again suppressed after the liberation of Belgium in 1944.

the cathedral, governor's house, observatory, library, museum, and hospital. A university was opened in 1911. The building where the parliament of Iceland meets contains a library rich in historical works. Most of the houses are built of wood. In the largest square is a statue of Thorwaldsen. There is steamer connexion with Copenhagen, and fish, butter, and skins are exported. During the Second Great War the town was the headquarters of the Allied occupation forces. Pop. 46,578.

Reymont, WŁADISŁAW STANISŁAW (1867-1925). A Polish novelist, born May 7, 1867. He wrote his first novel when superintendent of a small rly. sector. His best-known work *The Peasants*, appeared in 4 vols. during 1904-09; this epic described the labours of the four seasons, and was remarkable for its observation of bucolic life and character. Other works included *The Promised Land*, 1899; *Before Dawn*, 1902; *The Storm*, 1907. Reymont, who was awarded the Nobel prize for literature in 1924, died Dec. 5, 1925.

Reynard the Fox. Ancient animal legend or beast fable. Apparently of Oriental origin, with the fox as hero by reason of his superior cunning over the other animals, its satirical qualities grew with its European development. It is traceable in Germany to monastic Latin of the 10th century. There was a metrical version, *Reinardus Vulpes*, afterwards called *Isengrimus*, by a Flemish priest, Nivardus of Ghent, in 1148; and in 1180 another, *Isengrene's Not*, or *Reinhart Fuchs*, in Middle High German, by an Alsatian, Heinrich

de Glischezäre. Early in the 13th century a French priest, Pierre de St. Cloud, composed a poem on the subject, which inspired a Flemish poem, *Reinaert*, by J. F. Willems. A prose work, *Die Hystorie van Reynaert de Vos*, by Gerard Leeu, was printed at Gouda, Holland, 1479, from the Low German of which Caxton made a translation in 1481. The earliest printed German edition is one published at Lübeck in 1498. Goethe's *Reinecke Fuchs*, 1794, is a free version in hexameters of the Low German poem. There is an estimate of the comic and satirical qualities of the work in Carlyle's miscellaneous essays. A poem of the chase by John Massfield is entitled *Reynard the Fox*.

Bibliography. *Le Roman de Renart*, E. Martin, 1882-87; *Les Sources du Roman de Renart*, L. Sudre, 1893; *Reynard the Fox*, J. Jacobs, 1895; Caxton's trans., ed. E. Arber, 1895; metrical version, Ellis, 1897.

Reynaud, PAUL (b. 1878). A French statesman. Born Oct. 15, 1878, at Barcelonnette, Basses-Alpes, he entered politics in 1919, when elected deputy for his department. Minister for the colonies, justice, and finance in various cabinets during 1931-38, he was finance minister in the Daladier govt. until March, 1940, when he became premier. Reynaud

Paul Reynaud, French statesman

wanted to transfer the govt. to N. Africa, and when his colleagues did not support him resigned, June 17. In Sept. he was arrested and kept in prison or under house arrest in France until Nov., 1942, when, after the Allied invasion of N. Africa, he was handed over to Germans. Pétain had announced in Feb., 1942, that he would be tried for "misuse of funds," but he was never brought to trial.

Released by the U.S. 7th army from a prison camp at Oranienburg, Tyrol, May 6, 1945, he became a member of the constituent, and then of the national assembly, 1946. He was finance minister in André Marie's cabinet, July 26-Aug. 28, 1948.

Reynolds, GEORGE WILLIAM MACARTHUR (1814-79). British novelist and journalist. Born July 23, 1814, he travelled in France, and translated the works of Hugo and other French romantic writers, publishing (1839)

Modern Literature in France. In 1846 he became editor of the London Journal and founded Reynolds's Miscellany, which continued publication until 1869. During this period he also wrote sensational novels, *e.g.* *Mysteries of London*, 1846-55. Reynolds interested himself in politics from 1840 and became a leader of the Chartists. In 1850 he started Reynolds's Weekly Newspaper, which became the mouthpiece of advanced Radical views. It continued so when it passed under the control of Lord Dalziel, after which, as Reynolds' Illustrated News, it became the official organ of the cooperative movement. The name was changed to Reynolds News in 1936. It originated the heading Hatches, Matches, and Dispatches instead of the normal announcement of births, marriages, and deaths. Reynolds died June 17, 1879.

Reynolds, Sir Joshua (1723-92). British painter. He was born July 16, 1723, at Plympton, Devon.

Self-portrait

J. Reynolds

his father, Samuel Reynolds, being master of the grammar school there. He was at first intended for the medical profession, but showing aptitude for painting, was sent from home in 1740, and placed in the studio of Hudson, the best portrait painter of his day. After a while he returned to Devon, where he painted some twenty portraits, but in 1744 was back again in London, and five years afterwards went in the *Centurion* to the Mediterranean. He visited Lisbon, the Balearic Islands, Leghorn, Florence, and Rome, remaining in the latter place for two years, studying and copying the works

of the Italian masters. He then made a tour through other parts of Italy, and went to Paris. On his return to England he settled in London, in 1760 finally establishing himself in Leicester Square, where he remained until his death, making, however, occasional visits to Devon. From 1752 he suffered from deafness, which he attributed to the cold of the Vatican, where he had spent some time making copies of Raphael.

Reynolds was an exceedingly popular man in the best London society, acquainted with everyone worth knowing. His intimate friend was Johnson, whose death in 1784 was a severe blow to the artist. Others were Burke, Garrick, and Goldsmith, and it was Reynolds who, in 1764, suggested the formation of the Literary Club; in 1765 he became a member also of the Society of Dilettanti. When the Royal Academy was founded in 1768 Reynolds became its first president, and received the honour of knighthood, and for the next 20 years exhibited in its gallery some of his most notable pictures. He founded the R.A. schools, and delivered his first discourse to the students in 1769. The foundation of the R.A. banquet was also due to him, and he suggested the appointment of eminent men of the day to act with the Academy as honorary professors. He resigned his presidency of the R.A. in 1790, but was persuaded by his colleagues to resume the high position. A year afterwards, however, he became blind, and on Feb. 23, 1792, he died. He was buried in the crypt of St. Paul's cathedral.

Reynolds was the great English master of portraiture; an unerring draughtsman, a wonderful colourist gifted with a profound sense of decoration and a graceful humour. His portraits represent the finest of English art in its grandest form. As a writer on art he is chiefly remembered for his Discourses, which contain advice still valuable for students. His best pictures have been the subjects of engravings, nearly 800 contemporary plates having been prepared from his work. Many pictures have suffered from the strange experiments he tried in order to obtain the greatest brilliancy, but it has been wisely said that even a faded picture by Reynolds is greater than the works of any of his contemporaries. Fine examples of his pictures may be seen in the National Gallery, Wallace Collection, National Portrait Gallery, and

Royal Academy, and in many private collections in the U.K. and the U.S.A. Many of the portraits of his contemporaries in this encyclopedia are taken from his works, *e.g.* the duchess of Devonshire, Gibbon, Goldsmith, Dr. Johnson. See Painting.

Bibliography. Works of Sir J. R., E. Malone, 1797; History of the Works of Sir J. R., 4 vols., A. Graves and W. V. Cronin 1899-1901; Lives, J. Northcote, 1819; J. Farrington, 2nd ed. 1819; C. R. Leslie and T. Taylor, 1865; Sir C. Phillips, 1894; Sir W. Armstrong, 1900; Lord R. Gower, 1902; J. F. Molloy, 1906; F. Rutter, 1923; J. Steegman, 1933.

Reynolds, Samuel William (1773-1835). British engraver. Born in London, July 4, 1773, he

S. W. Reynolds,
British engraver
After J. Opie

he studied under C. H. Hodges. At first he painted in oils, and between 1797 and 1827 exhibited portraits and landscapes at the Academy, but his true *métier* was mezzotint engraving, his teacher being J. R. Smith. He engraved more than 300 portraits after Sir Joshua Reynolds, Lawrence, Opie, Northcote, Phillips, Dance, and others; and subject pictures after Morland, Northcote, and contemporary French painters. He was accomplished in etching, stipple, and aquatint, and was fond of combining one or more of these methods with mezzotint in one plate. He died Aug. 13, 1835.

Reynolds, Walter (d. 1327). English prelate. Aided to ecclesiastical preferment by Edward I, he became a favourite of Edward II, who made him bishop of Worcester, 1307, sent him on a mission to Avignon, 1309, and made him lord chancellor in 1310. He attended the council of Vienne, 1311, and in 1314 became archbishop of Canterbury. His private life and political influence were open to the charge that he was a time-server, but he effected several ecclesiastical reforms. Reynolds crowned Edward III in 1327, and died Nov. 16 of that year.

Rhadomancy (Gr. *rhabdos*, rod; *mantela*, divination). Divination by means of a rod or twig, and the discovery of water or ore thereby. See Divining Rod.

Rhadamanthus. In Greek mythology, the son of Zeus and Europa, and brother of Minos, king of Crete. On account of the upright-

ness of his life he was made one of the judges of the dead in Hades, the others being Minos and Aeacus.

Rhaetia or **RAETIA**. Province of the Roman empire lying S. of the Danube and corresponding roughly to the greater part of Tirol with the adjoining Grisons of Switzerland. It was conquered by the Romans under Drusus in 15 B.C., when most of its inhabitants were Celtic. See *Roma*.

Rhaetian Alps. Section of the Central Alpine system. They extend into Italy and Switzerland, and include the Bernina, Albula, and part of the Ortler Alps, and were named from the Roman prov. Rhaetia. The loftiest peak is the Piz Bernina, alt. 13,304 ft., and the chief pass the Splügen, nearly 7,000 ft. in alt. See *Alps*.

Rhaetic Beds. In geology, name given to those rocks found at the top of the Triassic and at the base of the Jurassic. The rocks show the characteristics of both the Triassic and the Jurassic, and were so called from their occurrence in the Rhaetian Alps. They consist of shales, limestone, marls, and sandstones, and contain many fossils, including those of some of the earliest known mammals. They are widely distributed, oc-

curing in Great Britain, Europe, Asia, America, and Australasia.

Rhatany. Foliage, flowers, and seeds; inset, single flower

curing in Great Britain, Europe, Asia, America, and Australasia.

Rhamnaceae or **BUCKTHORN FAMILY**. Large family of trees and shrubs. Natives of warm and temperate regions, they have undivided leaves and small green or yellow flowers. They have purgative properties. Some are used in medicine and in dyeing. See *Buckthorn* (*Rhamnus*).

Rhamnus. Ancient city of Greece, in Attica. It was a port on the N.E. coast, 24 m. N.E. of Athens and 8 m. N.E. of Marathon. It had several temples, notably one of Nemesis, built about 450 B.C.; another was dedicated to

Dionysus. Excavations have revealed remains also of a theatre and a fine statue of Themis.

Rhamporhynchus (Gr. *rhamporos*, crooked beak; *rhynchos*, snout). Extinct flying reptile, one of the Pterodactyls. Little is known about it, the only remains being found in the fine-grained lithographic stone of Bavaria, and those consisting of only part of the wings. See *Pterodactyl*.

Rhampsinitus. Classical name of the Egyptian Rameses III. In this form he is remembered in connexion with the story told of his treasure-house by Herodotus. The architect left a secret way into the treasure-house for his own enrichment, and at his death bequeathed the knowledge to his two sons, who promptly made use of it. Rhampsinitus tried by many stratagems to discover who robbed him, but was always outwitted by the thief. In various forms the story—that of the Master Thief cycle of tales—is found among many different peoples. Pausanias, in his Description of Greece (Bk. ix, 37), gives a similar account of the treasure-house of one Hyrieus.

Rhapsodists. In ancient Greece, professional reciters of the Homeric or other epic poems. The earlier rhapsodists sang to a harp, the later chanted the poems. Such recitations were a great feature of Greek life, and the reciters were held in high esteem. See *Greek Literature*.

Rhapsody (Gr. *rhaptein*, to sew together, compose; *ōdē*, ode). Fragment of an epic poem recited by a minstrel. A rhapsody in the modern sense is a musical composition of the fantasia type, generally founded on some national air, though not necessarily in variation form. Standard examples are by Brahms, Liszt, Rachmaninov, and Gershwin. Generally, the term implies any extravagant utterance or composition.

Rhatany (*Krameria triandra*). Shrub of the family Leguminosae. This native of Peru has alternate, oval, leathery leaves, covered with silvery hairs. The flowers are bright scarlet and irregular in form. The dried root with its red-brown bark is well-known in medicine, affording a form of tannic acid used as a tonic and as an astringent. The infusion is blood-red. *K. argentea*, from Brazil, with purple-brown bark, is used for the same purpose.

Rhayader. Market town of Radnorshire, Wales. It stands on the Wye, with a rly. station 14 m. S. of Llanidloes. It is chiefly an

agricultural centre, having been long famous for its sheep fairs. The town grew up around a castle built about 1180 by the English to defend the district against the attacks of the Welsh. The chief building is S. Clement's church, a Gothic building restored. The scenery around the town is very beautiful. Near are the valleys of the Elan and the Claerwen, with huge reservoirs that supply Birmingham with water. The full Welsh name, Rhayader-ar-Gwy, means falls of the Wye, there having been a waterfall here at one time. Pop. 900.

Rhea. In Greek mythology, daughter of Uranus, Heaven, and Ge, the Earth. She was the wife of Cronos (q.v.), by whom she was the mother of Zeus, Demeter, Hera, Poseidon, and Pluto. Rhea, originally a Cretan divinity, became early identified with the Phrygian goddess of nature and fertility, Cybele, whose worship at Pessinus was conducted with clashing cymbals and extravagant Oriental rites. In art, Rhea is represented as wearing a mural crown, and with lions either sitting by her throne or drawing her chariot. See *Atys*; *Corybantes*.

Rhea or **AMERICAN OSTRICH**. Genus of running birds. They occur only in S. America and resemble small ostriches except that the head and neck are feathered, the feet have three toes instead of two, and the tail is rudimentary. Three species are usually recognized, the common rhea, Darwin's rhea, and the long-billed rhea. The general colour of the plumage of all

Rhea. South American running bird allied to the ostrich
Gambier Bolton F.Z.S.

three is grey, but it differs in tone, and the species vary in size, the common rhea being the largest. The birds are found in small companies on the plains, several hens consorting with a cock and laying in a common nest. As with the ostrich, the cock bird undertakes the task of incubation. The birds run fast, and their colour makes it difficult to see them at even a short distance. They are hunted by horsemen armed with the bolas, a cord with a stone or weight at each end. Their feathers are used for feather dusters.

Rhea Silvia. In Roman legend the mother of Romulus and Remus, their father being the god Mars. Being a vestal virgin vowed to perpetual chastity, she was thrown into the Tiber by her uncle Amulius, but, according to one tradition, she was saved by, and became the wife of, the river-god. How her sons avenged the treatment of their mother is told under the entry Romulus. She is identified with the Greek Rhea, whose epithet *Idaea*, like the Latin *Silvia*, means "of the forests."

Rheims. Anglicised name of the French city, Reims (*q.v.*).

Rheine. Town in N. Rhine Westphalia, Germany, on the Ems, 29 m. W. of Osnabrück. It is a rly. junction and industrial centre. In the Middle Ages it was the capital of a small principality, and later became the property of the bishops of Münster. It has a Gothic church (1484), a castle (1437), and a bridge built in 1690. Its salt production dates back to the 11th century; modern industries are cotton spinning and weaving, engineering, and tobacco preparation. During the Second Great War Rheine and the surrounding network of airfields, fired by the Germans before they abandoned them, were captured April 2, 1945, by British forces. After Germany's unconditional surrender Rheine came within the British zone of occupation. Pop. 33,600.

Rheingau. District in the former province of Hesse-Nassau, Germany. Its area was slightly over 100 sq. m. The name was originally applied to an area parallel with the Rhine, beginning 4 m. W. of Mainz and stretching along the right bank for about 15 m., with a depth of 4-5 m., fenced off and enjoying sunny rights. The soil and a warm climate produce the finest Rhine wines. From the early Middle Ages it belonged to the archbishop-electors of Mainz, but fell to Nassau in 1803 and to Prussia

in 1815. It has one of the most beautiful landscapes of Germany and possesses many old castles. The chief town is Eltville.

Rheingold, Das. Opera by Wagner, the first of the four operas making up *Der Ring des Nibelungen*. Wagner stated that the music came to him during a sleepless night at an inn, and it was written down in 1853-54. The opera was first produced at Munich, Sept. 22, 1869, and in London at Her Majesty's Theatre, May 5, 1882. The first performance in English was given at Covent Garden, under Richter, in 1908.

Rhenium. Metallic element, symbol Re, at. no. 75; at. wt. 186.31; density 21.4 gm. per c.c.; melting point 3,167° C. It is a rare metal, first discovered in 1925, with properties intermediate between tungsten and osmium. Re 187 and Re 185 are the stable isotopes with relative abundances of 61.8 and 38.2 p.c. respectively.

Rheology. Science of the deformation and flow of matter. It thus includes elastic, plastic, or viscous types of deformation. The subject is of wide interest to chemists, engineers, and physicists. It is of considerable importance to all types of industry employing synthetic materials. In particular may be mentioned the rubber, plastic, textile, pottery, and foodstuffs industries.

Rheostat (Gr. *rhein*, to flow; *statos*, fixed). In electricity, an adjustable resistance to control the flow of electric current through a circuit. It is the electrical counterpart of a steam or water valve. A rheostat can assume various forms. A variable number of wire resistances may be connected in series, the number being varied by a contacting arm moving over a number of brass studs between which the resistances are soldered. Alternatively, the contact pressure between a number of carbon plates connected in series may be adjusted to vary the electrical resistance. Liquid resistances, acid or alkaline solutions, are also used.

The starting switches of railway, lift, and other motors are generally provided with a time control, which renders it impossible for the

full current to be admitted suddenly and burn out the windings. See Electricity.

Rhesus or BENGAL MONKEY (*Macacus rhesus*). Small long-tailed monkey of the family *Cercopithecidae*, common throughout the N. of the Indian sub-continent. It is usually nearly 2 ft. long in body, with a tail varying from 6 to 8 ins. Its fur is brown, with a greyish or greenish tinge, and the bare parts of the face are red in old specimens. Around Simla it occurs at considerable elevations among the mountains. It

Rhesus or Bengal monkey, an animal common in N. India
W. S. Berridge, F.Z.S.

is regarded as a semi-sacred animal by many Hindus, and may be found in the precincts of temples. It feeds mainly on fruit and seeds, but will also eat insects. In captivity it displays great intelligence, and is in favour as a pet. For its use as a subject of medical experimentation, see Rh Factor.

Rhetoric (Gr. *rhetorikē*). Originally the art of speaking effectively in public, and later extended to include the effective presentation of words either in oratory or writing. It has been defined as "that art or talent by which the discourse is adapted to its end."

The earliest treatise on rhetoric is that of Aristotle (4th century B.C.), in which it is regarded as a branch of logic, and as the means of establishing the superiority of truth over falsehood. Earlier rhetoricians had claimed that the end of rhetoric was to convince, whether rightly or wrongly; but the Aristotelian view came to be generally accepted. The three chief elements of rhetoric as applied to oratory were regarded as invention, arrangement, and elocution, though some writers included memory and utterance, both of which might be supposed to be included in the three named. There have been many modern works on rhetoric, such as Wilson's *Art of Rhetoric*, 1553, new ed. 1909; Campbell's *Philosophy of Rhetoric*, 1776; Blair's *Rhetoric and Belles Lettres*, 1817; Whately's *Elements of Rhetoric*, 1828; Cope's *Introduction to the Study of Aristotle's Rhetoric*, 1867; and Aristotle's *Rhetoric*, Eng. trans. Jebb and Sandys, 1909. See Oratory.
